

Designing the Characterization of a Site with Chlorinated Solvents

Ryan A. Wymore, P.E.

September 12, 2007

Presentation Outline

- ◆ Introduction
- ◆ Summary of basic concepts affecting characterization of chlorinated solvent sites
 - ◆ Physical properties
 - ◆ Fate and transport
- ◆ Major elements of chlorinated solvent contaminated site characterization
 - ◆ Hydrogeology
 - ◆ Contaminant distribution
 - ◆ Geochemical conditions
 - ◆ Microbiological
 - ◆ DNAPL source area architecture
- ◆ Summary

Introduction

- ◆ Chlorinated solvents are ubiquitous contaminants in soil and groundwater at sites throughout the US.
- ◆ For example, 8 of the top 20 contaminants detected at NPL sites are chlorinated solvents, including TCE (1st) and PCE (3rd).
- ◆ The U.S. Department of Defense (DoD) alone has approximately 3,000 sites contaminated with chlorinated solvents.

Introduction (cont.)

- ◆ Properties of chlorinated solvents present unique challenges for characterization and remediation.
- ◆ This presentation discusses how to design a characterization program for a chlorinated solvent site.
- ◆ For purposes of this talk, contaminants covered include chlorinated ethenes, ethanes, and methanes.
- ◆ Also, characterization is defined as the initial data collection performed prior to remediation implementation.

Major Concepts for DNAPL Fate and Transport

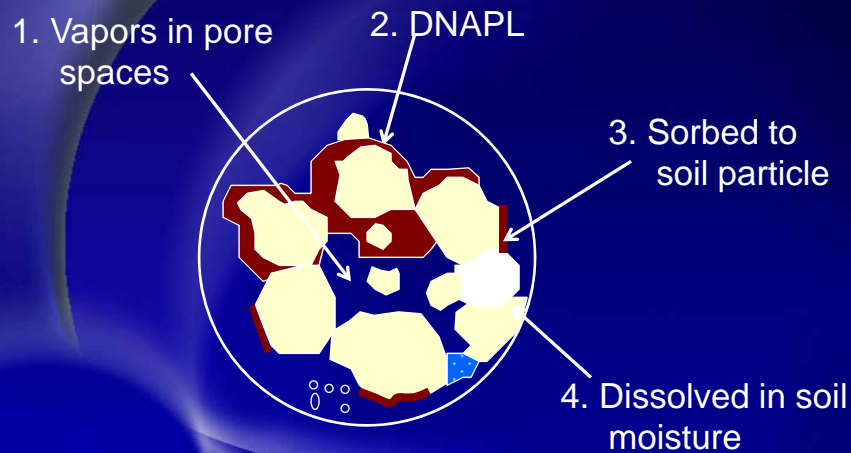

Several properties of chlorinated solvents impact design of a characterization program

- ◆ Partitioning
- ◆ Saturation
- ◆ Retardation
- ◆ Rebound

Partitioning of Contaminant

Source: ITRC, 2004

Saturation

$$S_{\text{NAPL}} = V_{\text{NAPL}} / PV$$

Source: ITRC, 2004

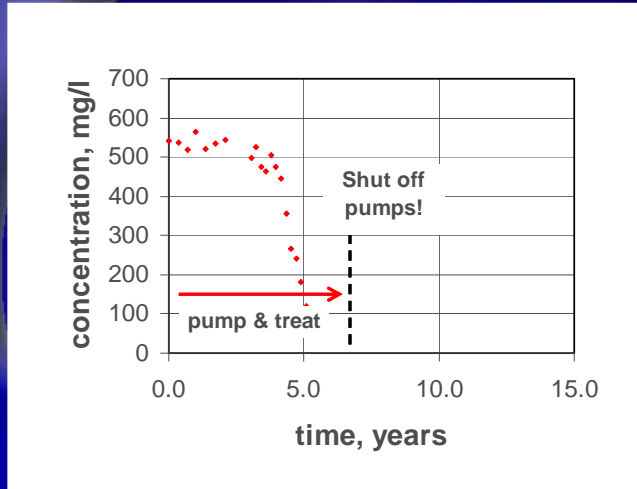

Retardation

- ◆ A dissolved species has a slower velocity than ambient groundwater flow
 - ◆ Sorption onto soil surfaces
 - ◆ Sorption onto organic matter
 - ◆ Partitioning into a non-aqueous phase

Reductive Dechlorination Pathway

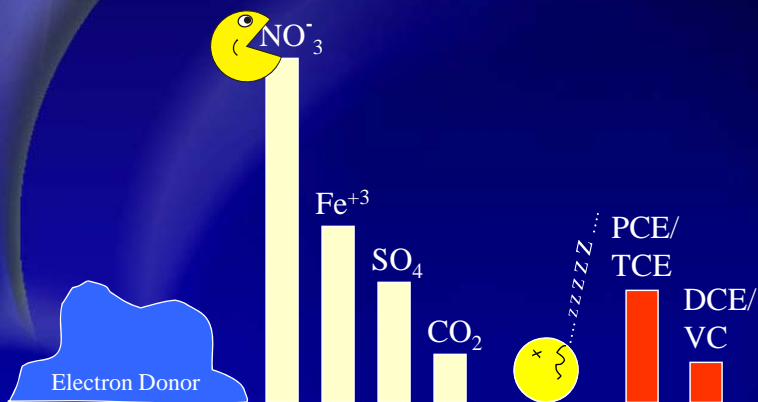

Oxidation-Reduction Potential and Energy

Electron Donor, Redox Conditions, and Dechlorination

Electron Donor, Redox Conditions, and Dechlorination

Electron Donor, Redox Conditions, and Dechlorination

Electron Donor, Redox Conditions, and Dechlorination

Electron Donor, Redox Conditions, and Dechlorination

Elements of Chlorinated Solvent Site Characterization: Hydrogeology

- ◆ As with any other contaminant, an in depth understanding of site hydrogeology is key.
- ◆ Key parameters
 - ◆ Depth to water and total depth of contamination
 - ◆ Hydraulic conductivity
 - ◆ Hydraulic gradient
 - ◆ Effective porosity
 - ◆ Aquifer matrix

Elements of Chlorinated Solvent Site Characterization: Hydrogeology

- ◆ Characterization activities
 - ◆ Water level measurements
 - ◆ Slug/pump tests
 - ◆ Tracer tests
 - ◆ Soil sampling (for physical properties)

Elements of Chlorinated Solvent Site Characterization: Hydrogeology

- ◆ Fractured rock sites present special challenges.
- ◆ It is important to understand the extent to which fractures control flow.
- ◆ Several techniques are available to assess fractured rock sites
 - ◆ Geophysical logging techniques
 - ◆ Televiewers
 - ◆ Heat pulse and electromagnetic flowmeters
 - ◆ Downhole video cameras
- ◆ These will be discussed in detail in a later session.

Example of fractured rock characterization

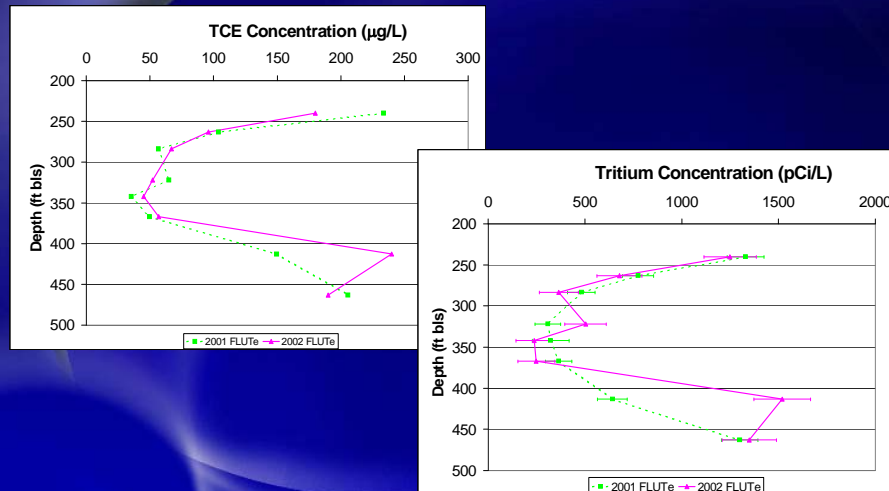

Elements of Chlorinated Solvent Site Characterization: Contaminant Distribution

- ◆ Key parameters:
 - ◆ Contaminant extent (i.e. leading edge of the plume)
 - ◆ Variation with depth (3-D distribution)
 - ◆ Presence of daughter products
- ◆ Characterization activities
 - ◆ Standard groundwater sampling
 - ◆ Temporary groundwater sampling using direct push technology
 - ◆ Multi-level sampling

Elements of Chlorinated Solvent Site Characterization: Contaminant Distribution

Elements of Chlorinated Solvent Site Characterization: Contaminant Distribution

- ◆ The concentrations of reductive daughter products needs to be assessed.
- ◆ In some cases these products are more mobile and more toxic than the parent contaminants.
- ◆ High concentrations of daughter products may indicate suitability of bioremediation or MNA as a remedy.

Elements of Chlorinated Solvent Site Characterization: Geochemistry

- ◆ Key parameters
 - ◆ Redox sensitive parameters – dissolved oxygen, nitrate, ferrous iron, sulfate, methane, ORP
 - ◆ Biological activity parameters – pH, alkalinity, total organic carbon/chemical oxygen demand
 - ◆ Water quality parameters – TDS, temperature, specific conductance, metals
- ◆ Data collection
 - ◆ Standard groundwater sampling techniques

Elements of Chlorinated Solvent Site Characterization: Geochemistry

- ◆ Redox conditions are invaluable for determining active processes in the subsurface.
- ◆ If processes are known to be active, remedies can be designed to enhance them.
- ◆ Limiting factors can be identified
 - ◆ Low/high pH
 - ◆ Limited buffering capacity
 - ◆ High TDS or metals

Elements of Chlorinated Solvent Site Characterization: Microbiology

- ◆ Key parameters
 - ◆ Heterotrophic plate counts
 - ◆ DNA data for key dechlorinating microbes
 - ◆ Microbial community profiling
 - ◆ RNA/metabolic activity
 - ◆ Enzyme activity
- ◆ Data collection
 - ◆ Standard groundwater sampling/filtering techniques with specialized analytical techniques

Elements of Chlorinated Solvent Site Characterization: Microbiology

- ◆ Analytical techniques
 - ◆ Quantitative polymerase chain reaction (qPCR)
 - ◆ T-RFLP community profiling
 - ◆ Clone libraries/DNA sequencing
 - ◆ FISH
 - ◆ Enzyme probe analysis

Elements of Chlorinated Solvent Site Characterization: DNAPL Architecture

- ◆ The characterization of DNAPL source areas is the most challenging aspect of chlorinated solvent sites.
- ◆ Since the source area “feeds” the plume, it must be understood in order to restore groundwater.
- ◆ DNAPL is not found at many sites; its presence is inferred from other data.
- ◆ Key parameters
 - ◆ Presence/absence of DNAPL
 - ◆ DNAPL saturation – mobile or residual source area
 - ◆ Mixture of contaminants

Elements of Chlorinated Solvent Site Characterization: DNAPL Architecture

- ◆ Data Collection
 - ◆ Standard groundwater sampling
 - ◆ Soil sampling in both vadose zone and saturated zone
 - ◆ Colorimetric methods (e.g. FLUTe Ribbon NAPL sampler)
 - ◆ Geophysical techniques
 - ◆ Partitioning interwell tracer tests
- ◆ Several techniques will be discussed in other sessions.

Executing the Characterization Program

- ◆ Data collection guidance should be followed
 - ◆ Data quality objectives process
 - ◆ Triad approach
- ◆ Several elements of the characterization program can be collected as a one time measurement
 - ◆ Hydraulic testing
 - ◆ “background” aquifer conditions (organic carbon, pH, buffering capacity)

Executing the Characterization Program

- ◆ Other parameters are more useful if more than one round of data are collected
 - ◆ Plume extent
 - ◆ Contaminants and daughter products
 - ◆ Redox conditions
 - ◆ Microbial community
- ◆ A mix of field and laboratory methods can be used
 - ◆ Field methods provide near real-time data; more data points collected for same price

Summary

- ◆ Characterization of chlorinated solvent sites involves elements similar to other contaminations.
- ◆ DNAPL assessment and microbiological characterization are somewhat unique to chlorinated solvent sites.
- ◆ Currently available methods can be used to guide data collection
