

## **What Waste Site Cleanup Professionals Need to Know about Stormwater**

**Presentation to  
NEWMOA**

**September 26, 2019**

## **Stormwater 101 for Cleanup Professionals**

- **Urban hydrology**
- **Water quality impacts & improvement**
- **Infiltration capacity, considerations, limitations**
- **Guidance document: stormwater infiltration systems in Connecticut urban fills**
- **Who to connect with in the states**

# Hydrology

# Water Quality Impacts

- Historical and new development
- Impaired coastal waters
  - Shellfish
  - Recreation
  - Fish/wildlife habitat
- Nonpoint sources
  - Stormwater runoff
  - Waterfowl
  - Marinas/boating

## Water Quality Impacts

### TMDLs

- About 40% of the nation's lakes, ponds, rivers, wetlands and coastal waters are listed as "impaired waters" because of point discharges (MADEP)
- Focus shift from nonpoint sources (urban and agricultural surface runoff) and subsurface sources (septic systems)
- Pollutant loads considered on a watershed scale
- Goal is to meet Water Quality Standards

## Water Quality Impacts

### TMDLs

**Pollutant loads**

Hydrology,  
stream  
hydraulics

Adsorption,  
absorption,  
other losses

Water  
quality  
standards

Federal requirement (Clean Water Act): if a water body doesn't meet State WQS for a pollutant a TMDL must be developed for ~~that~~ pollutant **Watershed scale**

## Water Quality Improvements

### Treatment:

- Physically adsorb onto a surface
- Biologically absorb into tissue
- Chemical alteration (to a less harmful state)
- Removal from system

### Typical treatment targets:

- Bacteria
- Total suspended solids (TSS)
- Heavy metals
- Nutrients primarily nitrogen & phosphorus

## Pollutant Removal Strategies

### Pollutant removal tools:

- EPA performance and optimization tools
- University of New Hampshire Stormwater Center  
<https://www.unh.edu/unhsc/>
- NHDES Stormwater Manual, Volume 2  
<https://www.des.nh.gov/organization/commissioner/pip/publications/wd/documents/wd-08-20b.pdf>
- Vermont Department of Environmental Conservation, Stormwater Management Manual  
[https://dec.vermont.gov/sites/dec/files/wsm/stormwater/docs/Permitinformation/2016\\_12\\_20%3B%202017\\_VSMM\\_Rule\\_Final.pdf](https://dec.vermont.gov/sites/dec/files/wsm/stormwater/docs/Permitinformation/2016_12_20%3B%202017_VSMM_Rule_Final.pdf)
- Chesapeake Conservancy
- Interstate Technology Regulatory Council (ITRC)  
<https://stormwater-1.itrcweb.org/>

# NHDES Stormwater Manual, Volume 2

## Chapter 3 Screening and Selecting Best Management Practices

CHAPTER 3

Best Management Practices (BMP) Screening

BMP	Description	Priority	Screening Criteria						Overall Score
			Cost	Effectiveness	Flexibility	Reliability	Maintenance	Public Acceptance	
1. Street Sweeping	Regular sweeping of streets and parking lots.	High	1	2	3	4	5	3	
2. Stormwater Infiltration	Installation of infiltration basins or trenches.	Medium	2	3	4	5	4	4	
3. Stormwater Detention	Installation of detention basins.	Medium	3	4	5	4	3	4	
4. Stormwater Treatment	Installation of treatment wetlands or ponds.	Low	4	5	4	3	2	4	
5. Stormwater Storage	Installation of storage basins.	Low	5	3	2	1	1	3	

# ITRC BMP Screening Tool

## ITRC Best Management Practices Screening Tool

- Pollutants of concern, environmental conditions, site restrictions, other factors

ITRC Stormwater Post-Construction BMP Evaluation Tool

RESET

**Pollutant Screening**

Pollutant	Score
<b>Ammonia Nitrogen</b>	100
<b>Biochemical Oxygen Demand</b>	100
<b>Chemical Oxygen Demand</b>	100
<b>Copper</b>	100
<b>Lead</b>	100
<b>Nitrate Nitrogen</b>	100
<b>Nitrite Nitrogen</b>	100
<b>Total Suspended Solids</b>	100
<b>Total Phosphorus</b>	100
<b>Total Nitrogen</b>	100
<b>Zinc</b>	100

**Related Practices (BMP)**

Practice	Score
1. Street Sweeping	100
2. Stormwater Infiltration	100
3. Stormwater Detention	100
4. Stormwater Treatment	100
5. Stormwater Storage	100

Reference

ITRC

# ITRC BMP Screening Tool

Pick pollutants – start with TSS

The screenshot shows the ITRC Stormwater Post-Construction BMP Evaluation Tool interface. It features three main panels:

- Pollutant Screening:** A list of pollutants with checkboxes. 'Total Suspended Solids' (TSS) is selected. Other pollutants include Total Phosphorus, Total Nitrogen, and various metals.
- Secondary Screening Criteria:** A list of criteria with checkboxes. 'Total Suspended Solids' is selected.
- Related Practices (BMP):** A list of BMPs with checkboxes. 'Total Suspended Solids' is selected.

A 'RESET' button is located at the top right. A 'Reference' section at the bottom right contains a 'Pathway Selected' button.

# ITRC BMP Screening Tool

Pick pollutants – add total dissolved

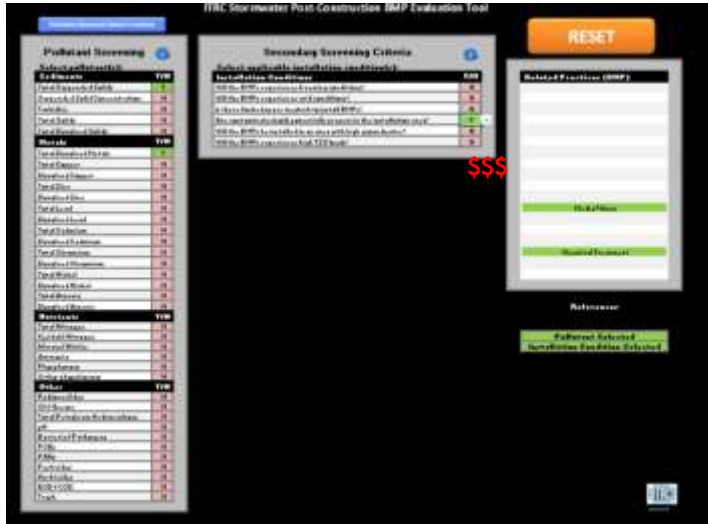

The screenshot shows the ITRC Stormwater Post-Construction BMP Evaluation Tool interface. It features three main panels:

- Pollutant Screening:** A list of pollutants with checkboxes. 'Total Suspended Solids' (TSS) and 'Total Dissolved Solids' (TDS) are selected.
- Secondary Screening Criteria:** A list of criteria with checkboxes. 'Total Suspended Solids' and 'Total Dissolved Solids' are selected.
- Related Practices (BMP):** A list of BMPs with checkboxes. 'Total Suspended Solids' and 'Total Dissolved Solids' are selected.

A 'RESET' button is located at the top right. A 'Reference' section at the bottom right contains a 'Pathway Selected' button.

# ITRC BMP Screening Tool

Site condition – contaminated soils in installation area

# Infiltration considerations

Subsurface conditions

- Soil type and permeability
- Bedrock
- Groundwater depth
- Presence of Contaminated soil

## Infiltration capacity

### Determine infiltration rate

- **Field Testing Requirements in “Soil Evaluation” of MA Stormwater Handbook**
- **Section 2-4 Design Infiltration Rate NH Stormwater Manual**
- **Field analysis conducted by**
  - Degree in Soil Science, Geology, or Groundwater Hydrology or
  - State-registered PE or
  - Engineer-in-Training (EIT) with civil degree
- **Methods**
  - Permeameter
  - Infiltrometer
- **Requires factor of safety of 2**

## Infiltration capacity

### Determine infiltration capacity of management area:

- **Empirical methods or numeric modeling**
- **Modeling based on Darcy’s Law**
  - ✓ Energy gradient
  - ✓ Hydraulic conductivity
  - ✓ Surface area
- **Impacts of climate change**
  - ✓ Infiltration capacity is what it is
  - ✓ Infiltration systems will see more frequent exposure to runoff
  - ✓ Overflow to gravity system!

USDA Soil Texture	Design Infiltration Rate ( $f_c$ ) (in/hr)
Sand	8.27
Loamy Sand	2.41
Sandy Loam	1.02
Loam	0.52
Silt Loam	0.27

## Considerations at contaminated sites

Current stormwater management practice is green infrastructure and low impact development, which rely on infiltration and groundwater recharge.

- Potential to mobilize contaminants and impact groundwater
- Can be overcome within regulatory framework
- Apply to new projects, redevelopment projects, retrofits of existing drainage systems

## Guidance document – infiltration in urban fill

Grant provided by CT Institute for Resilience and Climate Adaptation (CIRCA).

- Policies and regulations regarding stormwater quality, Low Impact Development practices, stormwater management and work in urban soils are in separate documents and permit programs
- Develop a Design Guidance Checklist that summarizes and guides project planners and designers through the regulatory requirements
- Define tasks needed to evaluate and design stormwater management systems in urban areas that may contain urban fill
- Checklist is CT-centric but can be adapted for any state

## **Guidance document – infiltration in urban fill**

- 1. Introduction**
- 2. Purpose**
- 3. Limitations**
- 4. Design Guidance for Stormwater Infiltration at Sites Characterized by Urban Fill**
- 5. Design Considerations**
- 6. Environmental Considerations**

## **Guidance document – infiltration in urban fill**

- 1. Introduction**
  - **Soils affected by history of development are sometimes referred to as urban soils or urban fill**
  - **Burning of wood and coal, industrial activity byproducts - heavy metals, PAHs**
  - **LID and GI address stormwater quality, groundwater recharge and flood resilience objectives. They can also mobilize contaminants and impact groundwater**
  - **Permit programs – municipal, state (MS4 and waste management)**

## Guidance document – infiltration in urban fill

### 2. Purpose

- Provide guidance for project planners and designers on the siting and design of stormwater infiltration systems in urban settings with historical urban fill. Examples include bioretention basins, rain gardens, water quality swales, subsurface infiltration chambers and trenches
- Guide project planners and designers through the appropriate requirements of applicable regulatory practices and policies
- Improve consistency in how planners and designers site and design LID, and green infrastructure, in Connecticut to meet water quality, flood resilience, and other objectives

## Guidance document – infiltration in urban fill

- Raise awareness of the potential to encounter urban fill in areas of proposed stormwater management
- Highlight the critical questions that should be asked to inform the design of an acceptable stormwater management system
- Identify the regulatory requirements that could apply to the design and construction of stormwater infiltration systems in urban fill

### 3. Limitations of design guidance

- Users of this checklist must be knowledgeable and proficient in land use and land development in Connecticut, and in particular:
  - Design and construction of stormwater management systems

## Guidance document – infiltration in urban fill

- Characterization of contaminated soils and groundwater  
Construction cost estimating
- Management of contaminated soils and groundwater
- Be familiar with applicable local, state and federal regulations

### 4. Design Guidance

- Identifying urban fill areas
  - Walk through
  - Topographic maps, NRCS maps
  - Test pits or geotech borings
  - Collect & analyze soil samples, evaluate data vs. regulations

## Guidance document – infiltration in urban fill

### Design approach factors

- Level of contamination
- Land uses
- Classification / potential use of groundwater

### Retention

### Treatment

## Guidance document – infiltration in urban fill

### Design approaches

#### Retain, discharge to stream

- “Hold runoff on-site” for water quality event (1”)
- Used in land use activities with potential for spills or high pollutant loads
- Structures, filter with liner
- Discharge to gravity drainage system
- Examples
  - Tank
  - Oversized drainage pipe
  - Leaching system with lined sides and bottom

#### Treat and infiltrate

- Removal of sediment, floatables, and nutrients that may clog the system or “mask” soils and reduce infiltration over time
- Treated runoff infiltrates into soil
- Overflow - Discharge to gravity drainage system
- Examples
  - Infiltration basin
  - Surface Bioretention
  - Permeable pavement
  - Water quality swale

## Guidance document – infiltration in urban fill

### Design considerations

#### Constructability

- Space: planimetric, disturbance footprint

## Guidance document – infiltration in urban fill

### Design considerations

#### Constructability

- Slopes: potential instability of saturated soil
- Surface restoration
- Depth to seasonal high groundwater
- Soil type

#### Land use / pretreatment needs

- Stormwater quality
- Potential for spill or high pollutant lo

## Guidance document – infiltration in urban fill

### Design considerations

#### Capacity needs

- High or low flow rates
- Bypass high rates to gravity system or watercourse

#### Separation distances

- Potable wells, septic systems, public water supply

## Design considerations

### Stormwater Management Standards

- Peak flow rate
- TSS removal
- Depth to groundwater
- Groundwater recharge

Hydrologic Group Volume to Recharge (x Total Impervious Area)	
Hydrologic Group	Volume to Recharge x Total Impervious Area
A	0.40 (NH) 0.60 (MA, VT) inches of runoff
B	0.25 (NH) 0.35 (MA, VT) inches of runoff
C	0.15 (NH) 0.25 (MA, VT) inches of runoff
D	0.00 (NH) 0.10 (MA) inches of runoff (Waived in VT)

## Design considerations

### Typical bioswale cross section

## Design considerations

### Design

#### Stormwater runoff model

- 1D (HydroCAD), 2D (PCSWMM)
- Calibration if possible

#### Design capacity

- On-site vs. off-site watershed contributions
- Design return frequency (high)
- Overflow to gravity outlet (low frequency storm)

#### Groundwater recharge

- Stormwater manual requirements
- Soil infiltration capacity (determine in-situ or in lab)

#### System footprint, constructability, other factors

## Who to contact

### Local stormwater authority

### State stormwater authority and permitting

**MA:** <https://www.mass.gov/info-details/stormwater>

**NH:**

<https://www.des.nh.gov/organization/divisions/water/aot/index.htm>

**VT:** <https://dec.vermont.gov/watershed/stormwater>

### Groundwater program

### Waste management program
