Soil Mixing for Environmental Remediation: An Effective Tool for Challenging Sites

Geotechnical improvement

In situ treatment

Contaminant containment

Contaminant S/S

• Part I – Dan Ruffing

Main takeaways

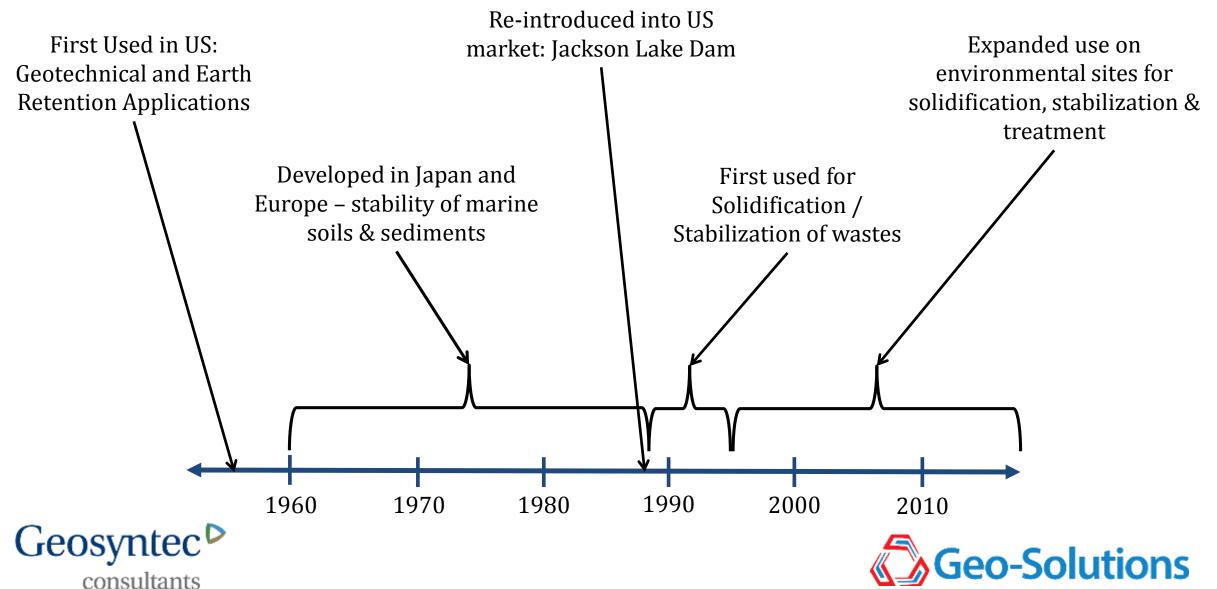

• Soil mixing is a delivery method: pick the reagents and use soil mixing to get good contact

 Soil mixing has been around and used for a long time and is a technically viable and cost effective solution for a variety of contaminants

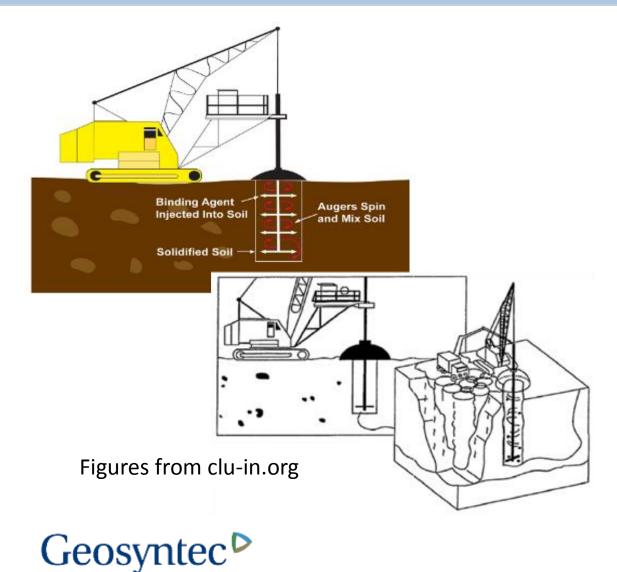

History

Process

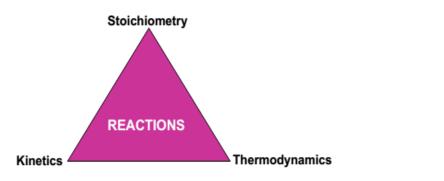

- Reagents added to and mixed with the soil.
 - <u>In situ</u>vs. ex situ
 - <u>Wet</u>vs. dry
 - <u>Auger</u> vs. bucket vs. rotary tool
 - <u>Single</u> auger vs. multi auger

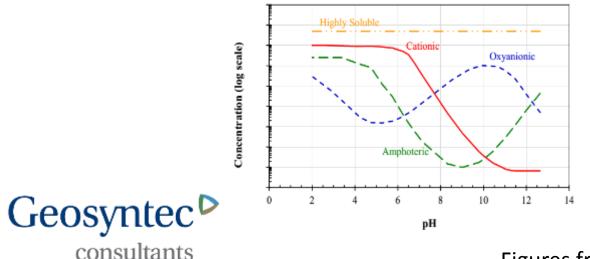

*Most common for environmental work

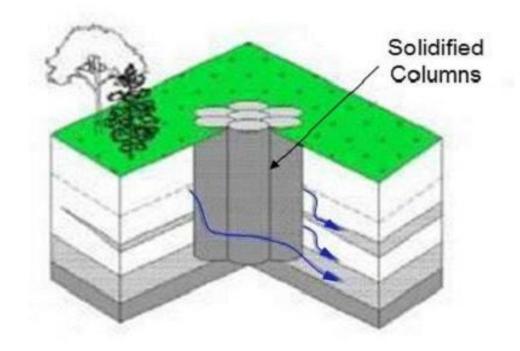

Stabilization and Solidification

• Stabilization: fixation, oxidation, reduction

• Solidification: encapsulation, fixation

Acronyms - S/S and ISS

 When stabilization and solidification are or may both be happening • When S/S is performed in situ

• = S/S

Common Reagents

- S/S:
 - Portland cement
 - Blast furnace slag
 - Bentonite
 - Kiln dust
 - Lime
- Ab- or Adsorption
 - Organoclay
 - Bentonite
 - Activated carbon

- Oxidation
 - Persulfates
 - Permanganates
 - Peroxides
- Reduction
 - Zero valent iron (ZVI)
 - Ferrous sulfate
- Biodegradation
 - EVO
 - guar

Steam Mixing / Air Stripping

- Steam or hot air can be pumped through the auger:
 - Volatilize contaminants
 - Collect the contaminants in a shroud
 - Trap the contaminant in a carbon (or other) filter

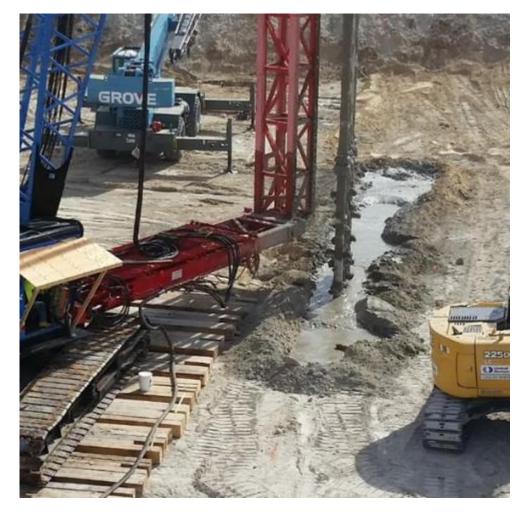

Air / Vapor Collection Shroud

Containment Walls

- Soil mixing can also be used to install containment walls
- Not the focus of this talk

Excavation Support

- Soil mixing can also be used to install excavation support
- Often used on sites where soil mixing is already specified – multiple objective w/ same technology = lower cost

Shallow Methods (< 15' or 20')

- Lowest cost
- Most primitive

- Better mixing than buckets
- Good for sludge, sediment

Deeper Methods (> 20' to 60'+)

- Better QC
- Most common method

- Highest cost
- Deeper / linear applications

Column Layout

- Columns can be installed in an <u>overlapping pattern</u> that ensures 100% coverage
- Test program can be used to observe installed product

Batch Plants

Accurate reagent addition is critical

Capabilities

- Depths up to 60' are common
 - deeper depths possible / have been completed
 - Deeper than 60' = more expensive
- Lowest cost for <u>shallower (<20')</u> applications

Bucket or rotary tool mixing

- Can be performed in <u>all soil types</u>
- Can be performed <u>below water table</u>:
 - no dewatering or excavation support

Limitations

- <u>Cannot</u> be performed in or through <u>rock</u>
 - some limited penetration may be possible
- <u>Cannot</u> be performed around or through <u>obstructions</u>:
 - boulders, groups of cobbles, old foundations, utilities
 - Shallow methods can accommodate some obstructions
- <u>Cannot</u> be performed around or through <u>utilities</u>
 - above and below ground are a problem

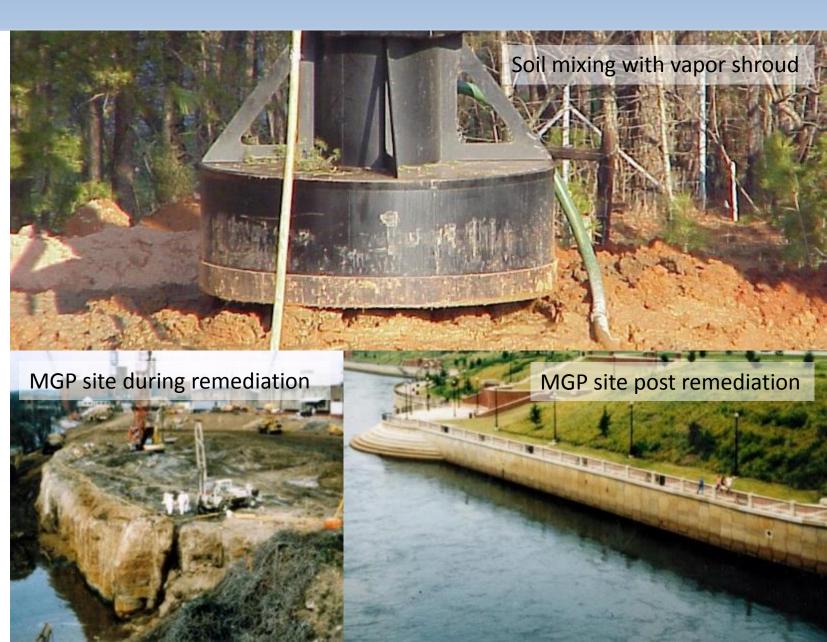

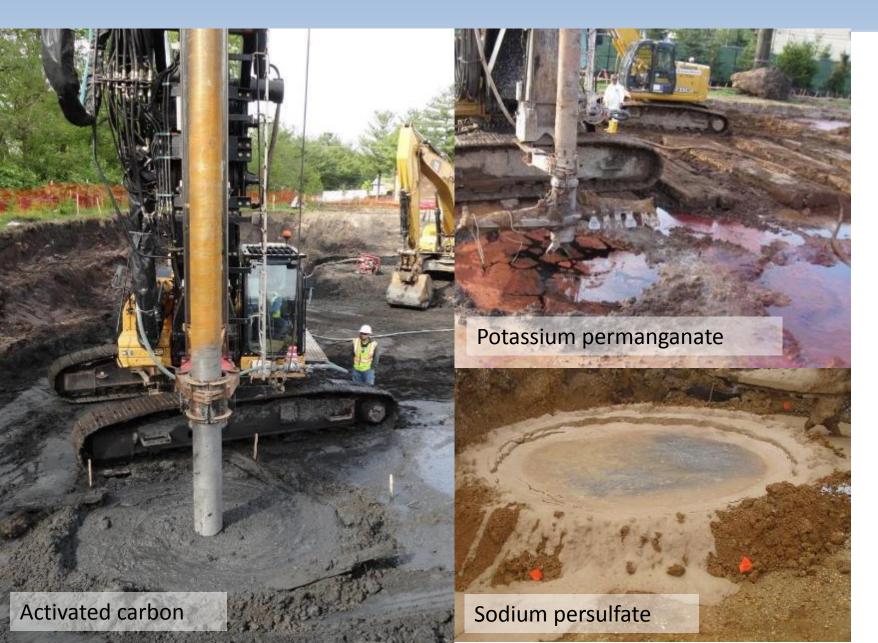

Industries & Applications

- S/S
 - MGP
 - Wood treating
 - PCBs
 - Metals

Industries and Applications

- Treatment
 - Chlorinated solvents
 - VOCs
 - SVOCs
