EPA, Corps of Engineers Move to Improve Wetlands Restoration and Conservation

Swamps, bogs, fens, and marshes – in short, wetlands – are as vital to our environment as coral reefs and rain forests. The Environmental Protection Agency (EPA) and Army Corps of Engineers (Corps) proposed a new rule to ensure more effective wetlands restoration and preservation nationwide. The agencies' rule, being published for public comment, proposes improved science and results-oriented standards to increase the quality and effectiveness of wetlands conservation practices under the Clean Water Act (CWA).

- For more information regarding compensatory mitigation and how to provide comments on the proposed standards, see: <http://www.epa.gov/wetlandsmitigation>
- Information about the importance of wetlands is available at: <http://www.epa.gov/owow/wetlands/>
- Additional information about the Corps' regulatory program can be found at: <http://www.usace.army.mil/inet/functions/cw/cacwo/reg/>
- To read the full press release click here: [Press Release](#) (long URL)

OVERVIEW

Water pollution degrades surface waters making them unsafe for drinking, fishing, swimming, and other activities. As authorized by the Clean Water Act, the National Pollutant Discharge Elimination System (NPDES) permit program controls water pollution by regulating point sources that discharge pollutants into waters of the United States. Point sources are discrete conveyances such as pipes or man-made ditches. Individual homes that are connected to a municipal system, use a septic system, or do not have a surface discharge do not need an NPDES permit; however, industrial, municipal, and other facilities must obtain permits if their discharges go directly to surface waters. In most cases, the NPDES permit program is administered by [authorized states](#). Since its introduction in 1972, the NPDES permit program is responsible for significant improvements to our Nation's water quality.

WHAT CAN I FIND ON THIS WEB SITE?

The site contains technical and regulatory information about the NPDES permit program. The NPDES Permits Program consists of a number of programs and initiatives. Links to each of these programs and initiatives are located on the left navigational bar.

Stormwater Program

OVERVIEW

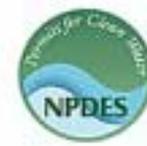

Stormwater discharges are generated by runoff from land and impervious areas such as paved streets, parking lots, and building rooftops during rainfall and snow events that often contain pollutants in quantities that could adversely affect water quality. Most stormwater discharges are considered point sources and require coverage by an NPDES permit. The primary method to control stormwater discharges is through the use of best management practices.

Most states are authorized to implement the [Stormwater NPDES permitting program](#). EPA remains the permitting authority in a few states, territories, and on most land in Indian Country.

On December 1, 2005, EPA proposed an [NPDES Stormwater Multi-Sector General Permit for Industrial Activities \(MSGP\)](#). This proposed permit will replace the MSGP-2000 that expired on October 30, 2005. EPA is seeking comments on the proposed permit and accompanying fact sheet. The comment period closes on February 16, 2006.

WHAT CAN I FIND ON THIS WEB SITE?

This page contains technical and regulatory information about the NPDES stormwater program. It is organized according to the three types of regulated stormwater discharges and provides a link to Stormwater Month outreach materials:

What is the ETV Program?

EPA's Environmental Technology Verification (ETV) Program develops testing protocols and verifies the performance of innovative technologies that have the potential to improve protection of human health and the environment. ETV was created to accelerate the entrance of new environmental technologies into the domestic and international marketplace. ETV is also verifying monitoring and treatment technologies relevant for water security.

How Does ETV Operate?

- ETV, which began in October 1995, operates through public/private testing partnerships to evaluate the performance of environmental technology in all media: air, water, soil, ecosystems, waste, pollution prevention, and monitoring.
- Market input is conveyed by the active involvement of stakeholder groups consisting of technology buyers, sellers, permittees, consultants, financiers, exporters and others within each sector.
- Any technology vendor within each technology category selected by stakeholders for verification is welcome, but in no way required, to participate.
- All test/quality assurance plans and protocols are developed with the participation of technical experts, stakeholders, and vendors; available prior to testing; peer reviewed by other experts; and updated after testing, as appropriate.

Done Internet

The screenshot shows a Microsoft Internet Explorer browser window displaying the EPA Stormwater Case Studies website. The browser's address bar shows the URL: <http://cfpub.epa.gov/npdes/stormwater/casestudies.cfm>. The website header features the U.S. Environmental Protection Agency logo and the title "National Pollutant Discharge Elimination System (NPDES)". A search bar for NPDES is present, along with navigation links for "Recent Additions", "Contact Us", and "Print Version". A breadcrumb trail reads: "EPA Home > QM Home > QAM Home > NPDES Home >".

The main content area is titled "Stormwater Case Studies" and includes a sub-header "U.S. Environmental Protection Agency National Pollutant Discharge Elimination System (NPDES)". Below this, there are navigation tabs for "NPDES Topics", "Alphabetical Index", "Glossary", and "About NPDES". The text explains that EPA has developed a series of stormwater case studies to help Phase II municipal separate storm sewer systems (MS4s) get started on or improve their stormwater management programs. Each case study is a two- to three-page description of how a Phase I or Phase II community has implemented a specific aspect of its stormwater program. The case studies are organized by minimum measure, but they do not necessarily represent all the activities that each community is undertaking to implement that minimum measure. Each case study description includes links to materials that further describe or were developed for the case study and the minimum control measure.

Below the text, it states: "You can search the stormwater case studies in three different ways:"

The first search method is "Browse Case Studies by Minimum Control Measure". It features a dropdown menu labeled "Pick a minimum control measure:" and a "View" button.

The second search method is "Select a Case Study by Location Or Title". It features two dropdown menus: "Pick a case study location:" and "Pick a case study title:", followed by a "View" button.

The left sidebar contains a navigation menu with the following categories and sub-items:

- Construction Activities
 - 2003 Construction
 - General Permit
 - Oil and Gas
- Industrial Activity
 - Multi-Sector General Permit
- Municipal MS4s
 - Large & Medium
 - Small
- Stormwater Outreach Materials
- Phase I & Phase II
 - Menu of BMPs
 - Urbanized Area Maps
- Stormwater Home

The right sidebar contains a "Stormwater Information" section with the following links:

- [Recent Additions](#)
- [FAQs](#)
- [Publications](#)
- [Regulations](#)
- [Training & Meetings](#)
- [Links](#)
- [Contacts](#)

At the bottom right of the sidebar, there is a "Sign Up For NPDES NEWS" button.

An Internet Guide to Financing Stormwater Management

Welcome. This Web site was developed by the Center for Urban Policy and the Environment at Indiana University-Purdue University Indianapolis (IUPUI) in cooperation with the Watershed Management Institute, Inc. Funding was provided by the United States Environmental Protection Agency Office of Water through Cooperative Agreement CX824413 with the Institute.

This Web site is designed to help communities find ways to pay for stormwater management projects. The site includes:

- an [annotated bibliography](#) of existing stormwater finance materials
- an [archive](#) that contains selected previously published materials concerning stormwater finance
- a [manual](#) that discusses the financing options available to communities for stormwater management programs
- a set of [case studies](#) that describe successful finance mechanisms that have been used in seven communities around the country
- a group of [links](#) to other useful web sites about stormwater management

For more information about this site and its organization, click on the menu item "About This Site" on the left side of the page. For help learning how to navigate this site, [click here](#).

NOTE: The materials on this web site are available in Adobe PDF format and you will need the Adobe Acrobat Reader software to view them. The Adobe Acrobat Reader software is free. If you do not have it, click on the **Get Acrobat Reader** button below to connect to the Adobe web site and download it. Thank you for visiting!

International Stormwater Best Management Practices (BMP) Database

Home	*****
Database	New: Analysis of treatment system performance (1999 - 2005): <u>DB_Download/BMP_Performance_Summaries_Feb_2006.zip</u>
Reports/Software	
Project Background	*****
Contacts/Sponsors	

Project Sponsors

Welcome to the International Stormwater Best Management Practices (BMP) Database project web site, which features technical documents, software and database developed over the past decade. The overall purpose of the project is to provide scientifically sound information to improve the design, selection and performance of BMPs. To accomplish this goal, the Project Team has developed tools to promote scientifically-based collection and management of the data needed to evaluate the effectiveness of stormwater runoff BMPs. These tools include standardized BMP monitoring and reporting protocols, a stormwater BMP database, BMP performance evaluation protocols, and BMP monitoring guidance. Continued population of the database and assessment of its data will ultimately lead to a better understanding of factors influencing BMP performance and help to promote improvements in BMP design, selection and implementation.

The project, which began in 1996 under a cooperative agreement between the American Society of Civil Engineers ([ASCE](#)) and the U.S. Environmental Protection Agency ([USEPA](#)), now has support and funding from a broad coalition of partners including the Water Environment Research Foundation ([WERF](#)), ASCE Environmental and Water Resources Institute ([EWRI](#)), USEPA, Federal Highway Administration ([FHWA](#)) and the American Public Works Association ([APWA](#)). [Wright Water Engineers, Inc.](#) and [GeoSyntec Consultants](#) are the entities maintaining and operating the database clearinghouse and web page, answering questions, conducting analyses of newly submitted BMP data, conducting up-dated performance evaluations of the overall data set, disseminating project findings, and expanding the database to include other approaches such as Low Impact Development techniques. The database itself is downloadable

Low Impact Development (LID) Urban Design Tools

This site provides watershed managers with a new set of tools and techniques that can be used to meet regulatory and receiving water protection program goals for urban retrofits, re-development projects, and new development sites.

[Interactive Design Page](#) | [Site Map](#)

[IMP Standards and Specifications](#) **new!!**

This site has been developed through a Cooperative Assistance Agreement under the US EPA Office of Water 104b(3) Program in order to provide guidance to local governments, planners, and engineers for developing, administering, and incorporating **Low Impact Development (LID)** into their aquatic resource protection programs. LID technology is an alternative comprehensive approach to stormwater management. It can be used to address a wide range of Wet Weather Flow (WWF) issues, including Combined Sewer Overflows (CSOs), National Pollutant Discharge Elimination System (NPDES) Stormwater Phase II permits, Total Maximum Daily Load (TMDL) permits, Nonpoint Source Program goals, and other Water Quality Standards.

Revised: May 16, 2003

This site designed by:
Low Impact Development (LID) Center
A non-profit organization balancing growth and environmental integrity.

W elcome!

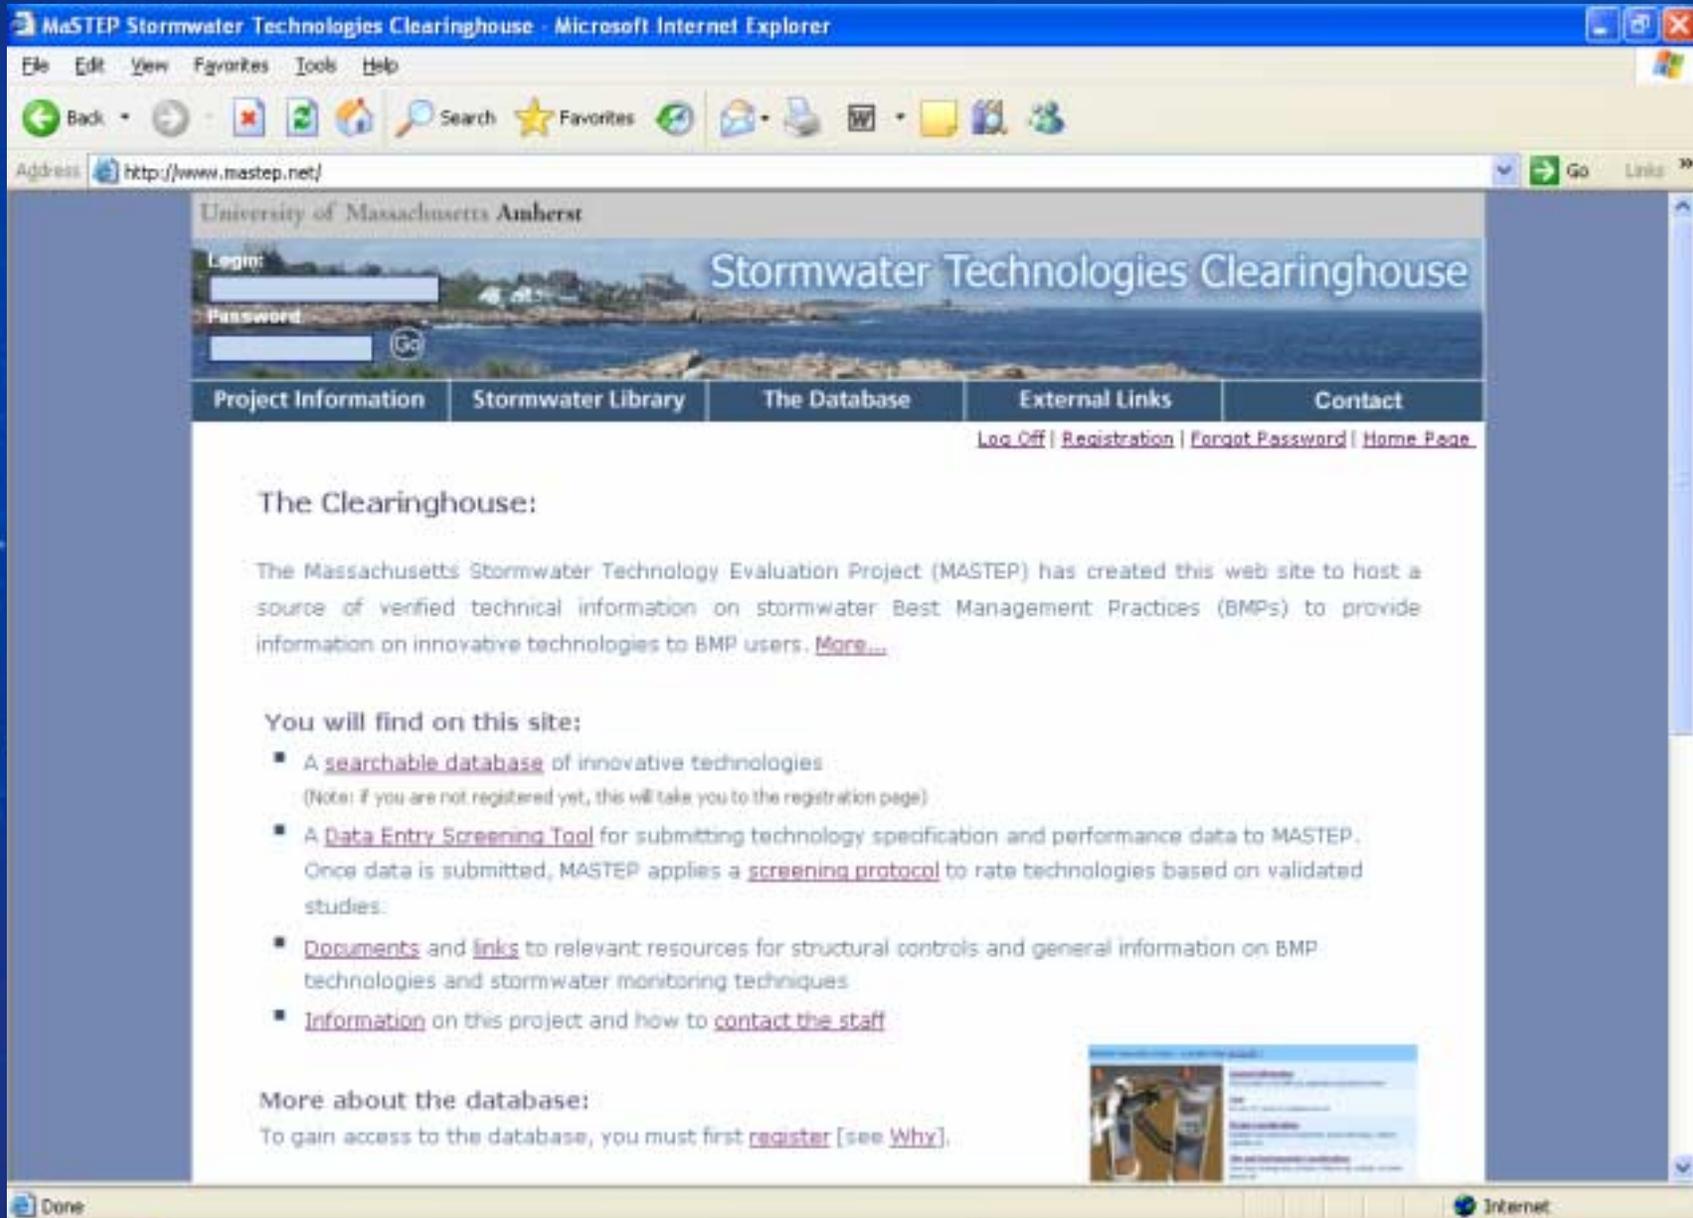

Take part in
[World Water Monitoring Day](#)
October 18, 2006

This site was created as a joint effort of America's Clean Water Foundation and the Association of State and Interstate Water Pollution Control Administrators to convey important information relating to **Total Maximum Daily Loads** (TMDLs). Portions of this site have been supported by grants from the United States Environmental Protection Agency. Additionally, the USEPA is also providing technical assistance.

The **Goal** of this site is to enhance State and local capacity to develop and implement TMDLs and other watershed-based approaches to help solve water quality issues. It accomplishes this task by helping to:

- Educate stakeholders on challenges and opportunities that TMDLs present.
- Share useful information, tools, and effective approaches being used by the States.
- Foster communication among stakeholders and promote involvement in problem-solving at the local level.

UNH Stormwater Center

Dedicated to the protection of water resources through effective stormwater management

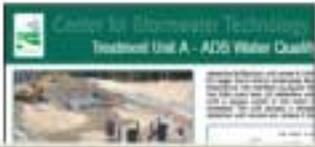

The UNH Stormwater Center will hold **12 BMP Technology Demonstration Workshops** at its unique facility on UNH's Durham, NH campus starting April 13. The workshops will run through November 21. Spaces are going fast so register now! More information is available [here >>](#)

Interactive Stormwater Project Site Plan

An interactive project map gives an overview of the project as well as detailed drawings of treatment units. [More >>](#)

Treatment Unit Fact Sheets

These fact sheets include information about all 11 of the current stormwater treatment devices presently on-site at the Stormwater Center's research facility. The signs include basic information about the device, its footprint, the source of its design, its expected

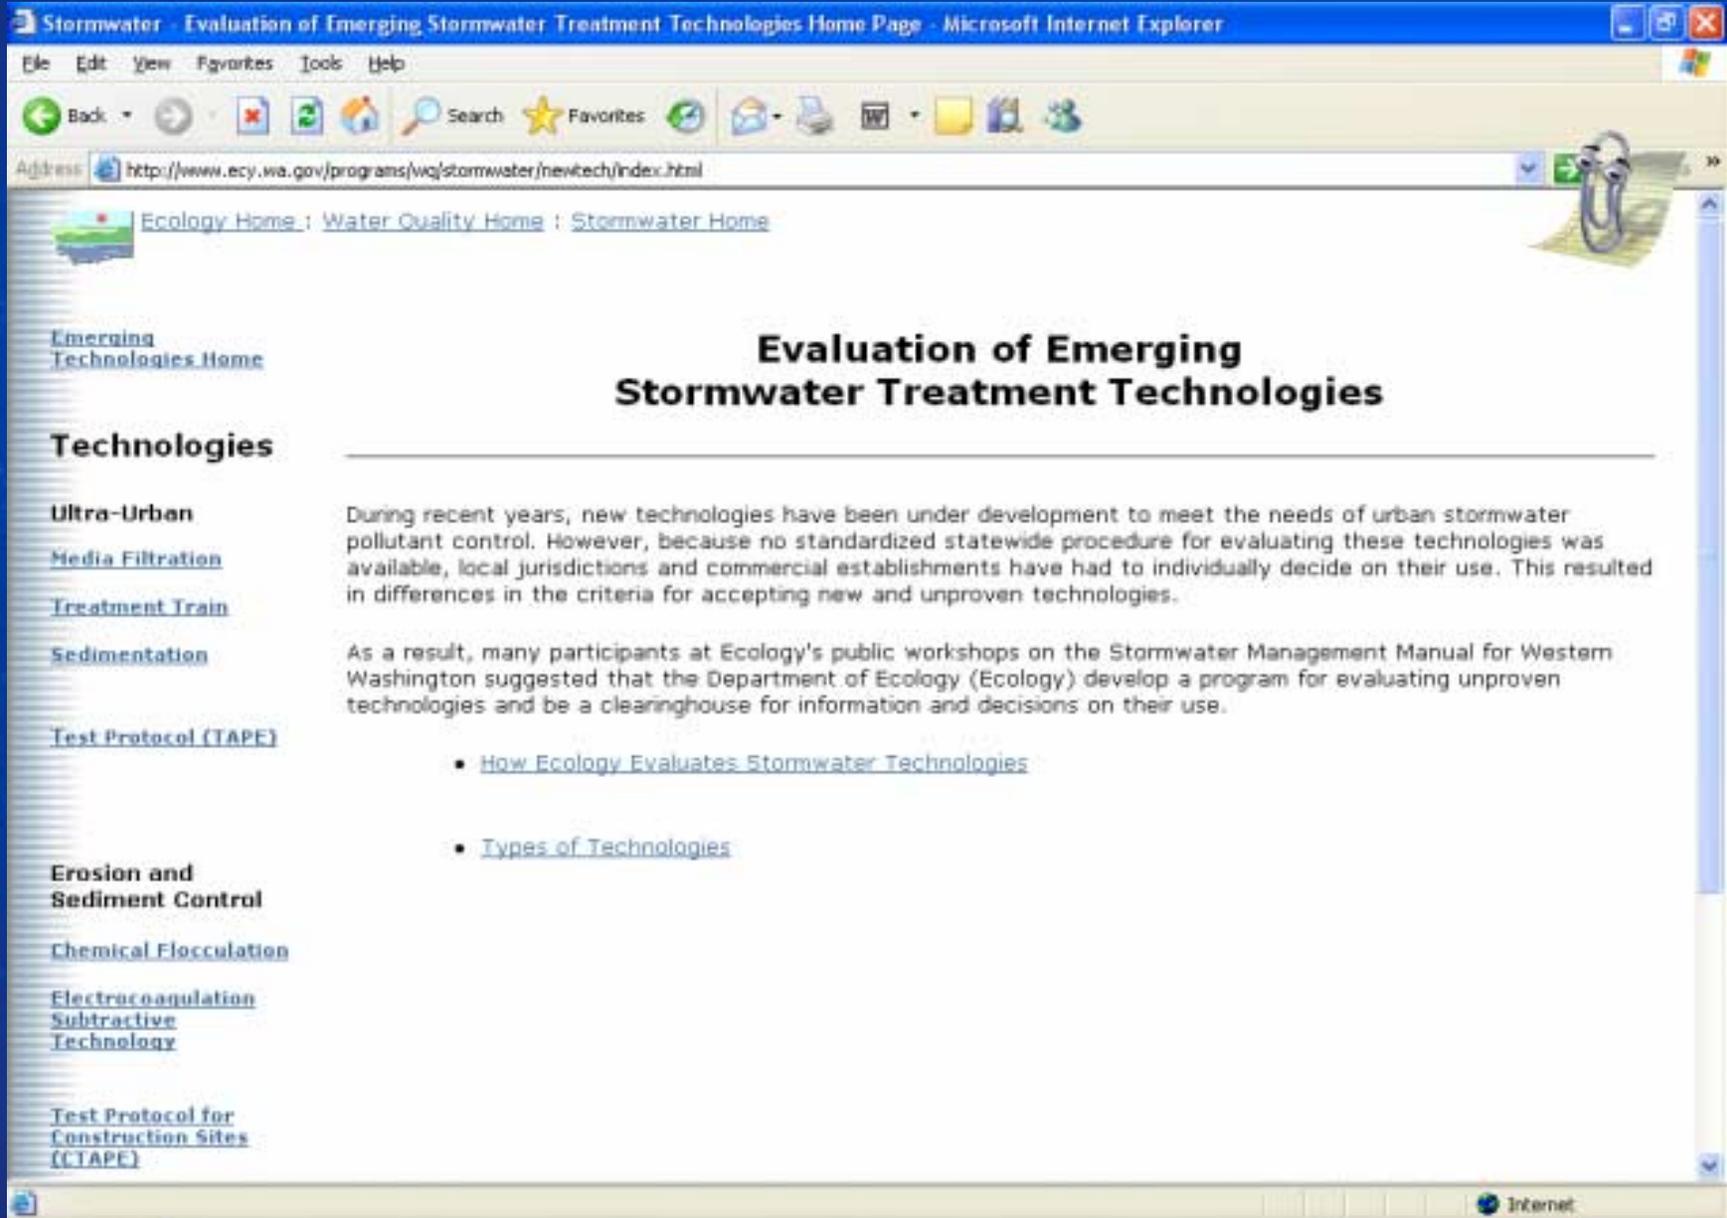

Funding provided by NOAA through a grant from CICEET.

During recent years, new technologies have been under development to meet the needs of urban stormwater pollutant control. However, because no standardized statewide procedure for evaluating these technologies was available, local jurisdictions and commercial establishments have had to individually decide on their use. This resulted in differences in the criteria for accepting new and unproven technologies.

As a result, many participants at Ecology's public workshops on the Stormwater Management Manual for Western Washington suggested that the Department of Ecology (Ecology) develop a program for evaluating unproven technologies and be a clearinghouse for information and decisions on their use.

**Welcome to Smart WaterWays,
the Chittenden County stormwater website!**

What is Stormwater Runoff and Why Is it a Problem?

Stormwater runoff occurs when water from rain or snowmelt flows over the ground. Stormwater can pick up pollutants such as oil and grease, chemicals, nutrients, metals and bacteria and flow into stormwater systems or directly to the lake, streams, rivers or wetlands. Anything that enters the stormwater system is discharged untreated into the waterways we use for swimming, fishing and providing drinking water.

Making little changes in your daily habits, you can help keep pollutants out of our stormwater. [Click here to find healthy habits for clean water.](#)
