

Current Trends in PFAS Source Differentiation

“The Science of PFAS Conference”

April 6, 2022

Agenda

1

Introduction

2

PFAS Source differentiation techniques

3

Visual Presentation Tools

4

Representatives Uses – groundwater, surface water and overburden soils investigations

5

Questions and discussion

Introduction

Why? To identify release sites and address recalcitrant sources

- Water supply impacts are widespread and very costly to mitigate,
- Widespread use : consumer products, industrial applications, hydrocarbon (Class B) fire response,
- Common sources include: stormwater, wastewater, landfills, and fire training and emergency response areas

Strategic Environmental Research Development Program (SERDP) 2020 Statement of Need: *“Forensic Methods for Source Tracking and Allocation of PFAS”*

Multiple Lines of Evidence Approach Needed

- Changes in manufactured PFAS mixtures over time
 - Limits the ability to use impurities or unique structures
 - Recalcitrance of the primary perfluorocarbon structures
- Filtered analytical data sets due to availability of reference materials
 - Low concentrations also limits the applicability of stable isotope analysis
- Geochemistry – controls PFAS mobility and speciation
 - Environmental transformation leads to common endpoints
- Hydrogeology – groundwater flow paths and aquifer conditions
 - Upgradient concentrations and potential release points?
 - You can't get there from here!

Perfluorinated Chemical (PFC) Manufacturing Processes

1950's through 2001

Electro Chemical Fluorination (ECF) process

- C-8 feedstock produced a complex and variable mixture of compounds
- branched and linear fluorocarbon compounds

Fluorotelomerization process – 1980's to present

- Produces linear isomers of varying fluorocarbon chain lengths (N+2)
- Specific products utilize odd vs. even numbered perfluorocarbon chains

1980's

Linear and Branched Isomers of PFOA

Product of both ECF and FT synthesis

Product of ECF Only

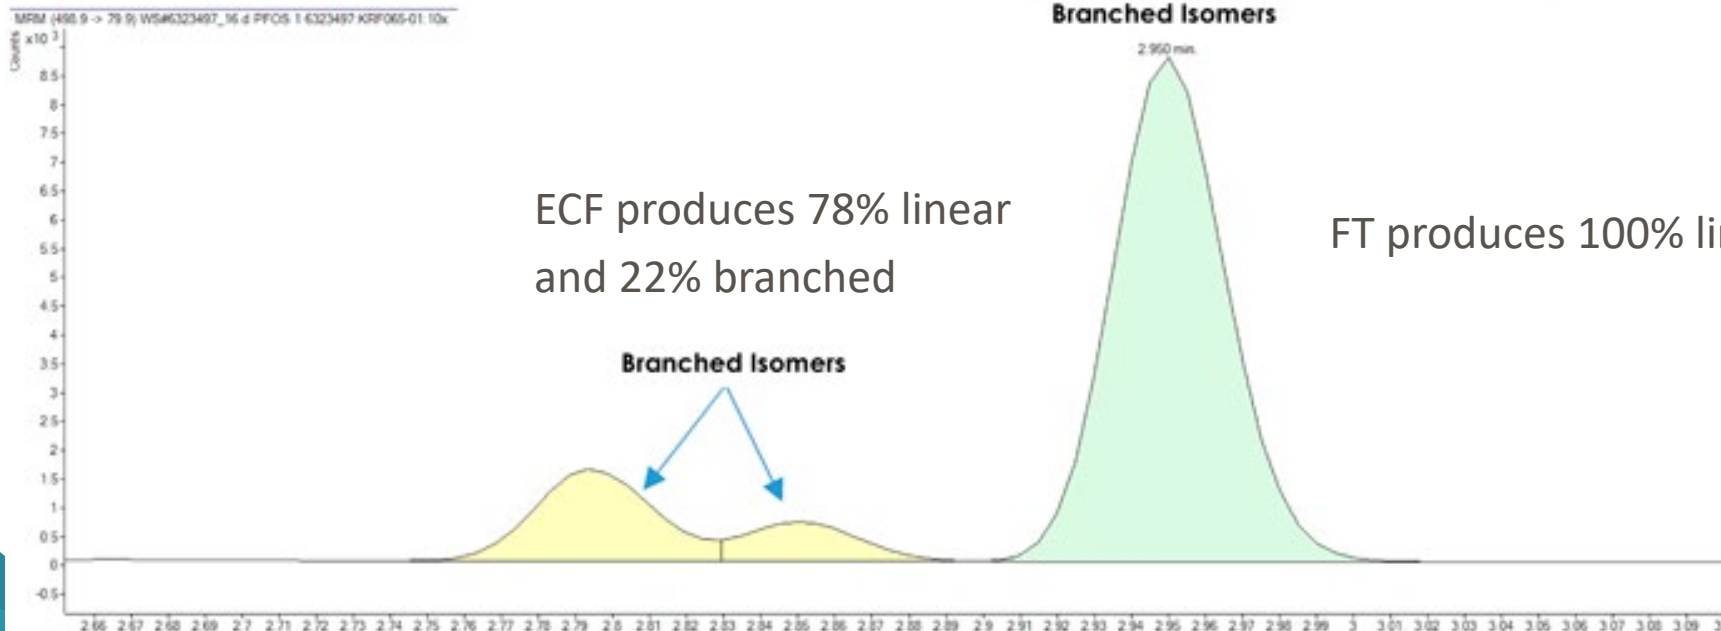

Linear PFOA

Branched PFOA

**Linear + Co-eluting
Branched Isomers**

ECF produces 78% linear
and 22% branched

FT produces 100% linear

Targeted PFAS Analysis Procedures (LC MS/MS)

EPA Method 537.1 (March 2020) Version 2.0 – DW Matrices

- 18 Target Analytes including PFCA/PFSAs, PFOSAs, F53-Bs, Gen-X and Adona

EPA Method 533 (December 2019) – DW Matrices

- 25 Target Analytes adding FTS, C2/C3/C4 PFMAAs, and
 - Nonafluoro-3,6-dioxheptanoic acid (NFDHA)

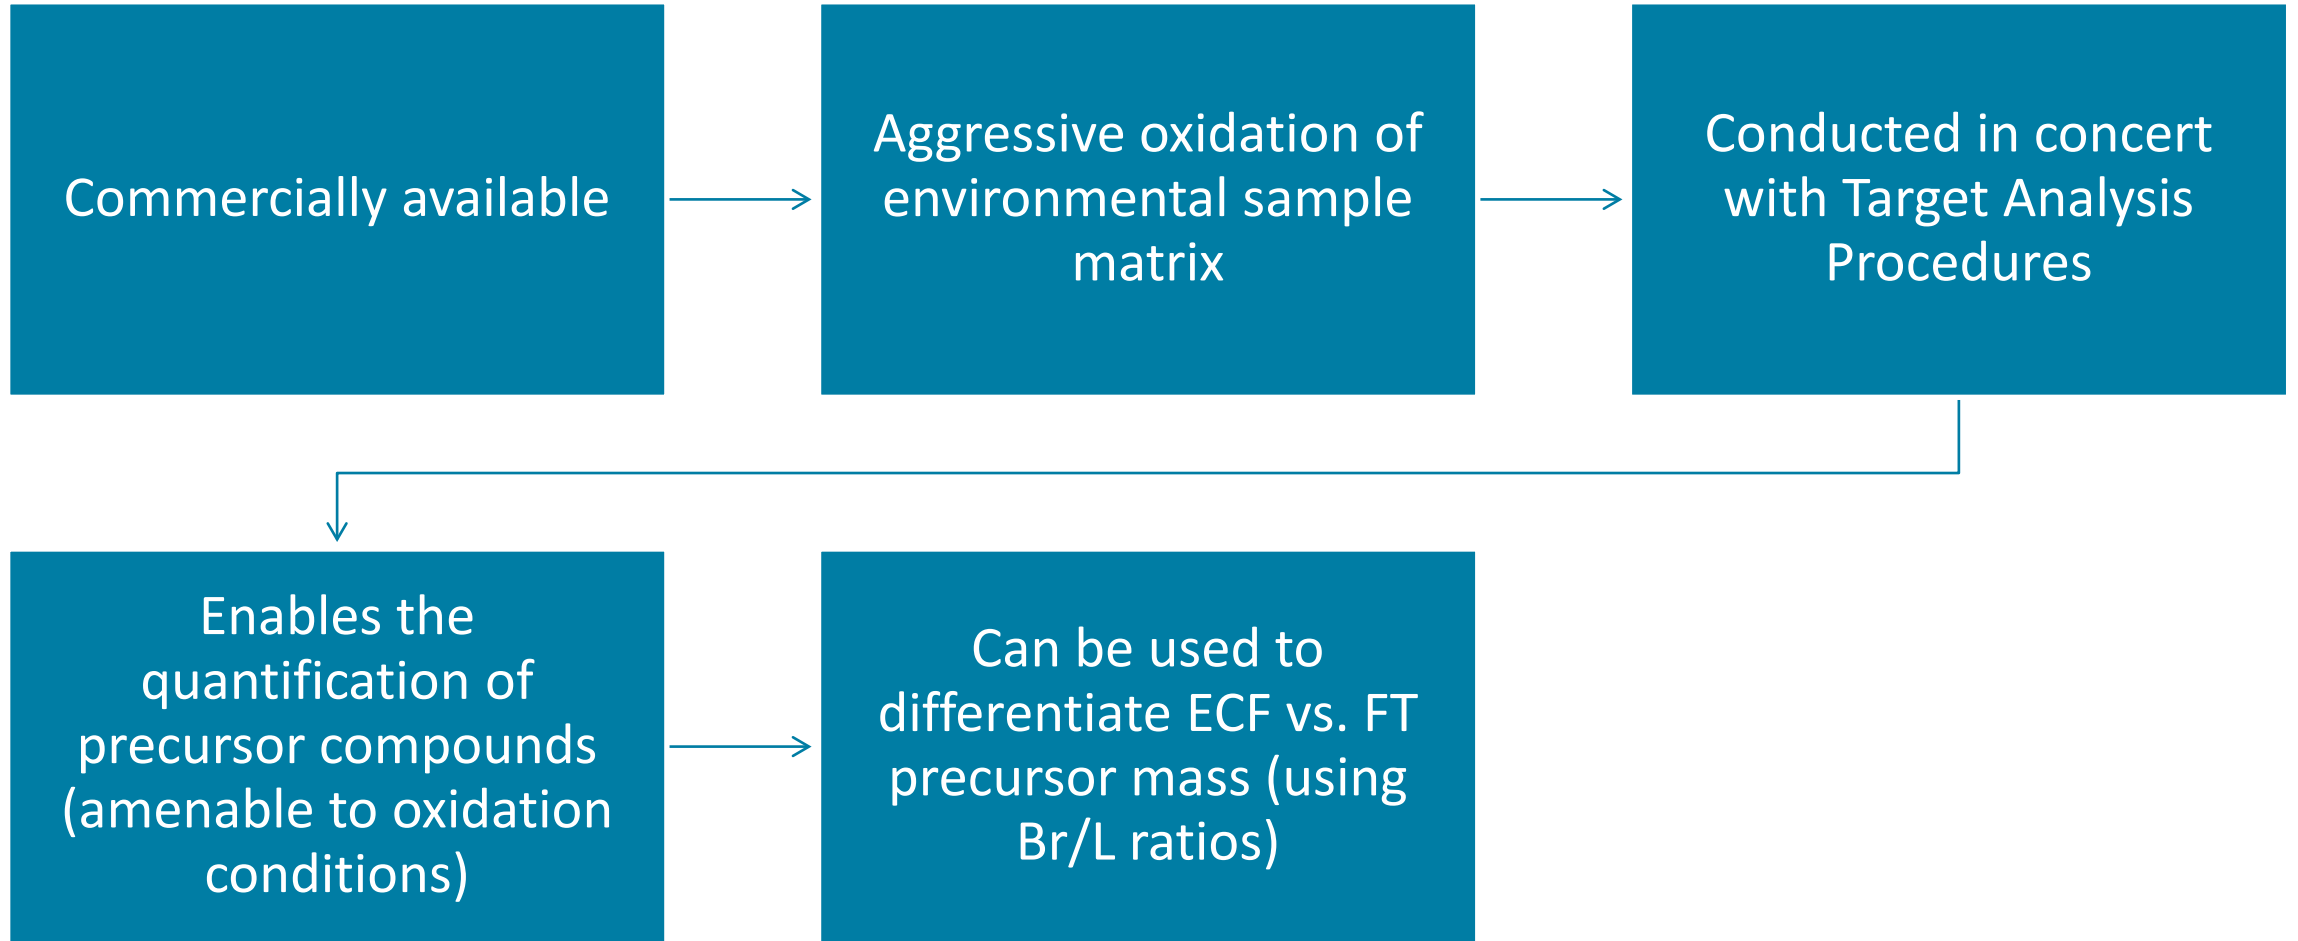

DRAFT EPA Method 1633 (Aug. 2021) – Non-DW Matrices

- 40 Target Compounds – All of the above plus, PFOSAAAs, PFOSEs, FTCAs
- Multi-lab Validation Study underway

EPA Method 537.1- Modified – Non-DW Matrices

- Laboratory Specific Lists – up to >70 compounds
- Limited by available stable isotope analogs

Total Oxidizable Precursor (TOP) Assay/Analysis

Non-Target PFAS Analysis Methods

LC/GC High Resolution Mass Spectrometry (HR-MS)

- Can separate and identify a wide range of non-target analytes
- Semi-quantitative analysis with use of known internal standards
- Tentatively Identified Compound structures requires reverse engineering

Fast Atom Bombardment Mass Spectrometry (FAB-MS)

- Product Analysis for PFAS constituents
- Rapid identification of known and unknown structures

Example Non-Target Analysis Indicator Compounds

- Perfluoroalkyl sulfonamido amino carboxylic acid (PFASAC)

- Perfluoroalkyl sulfonamido amine (PFASA)

- Fluorotelomer thioamido sulfonic acid (FTSAS)

- Fluorotelomer sulfonamide alkyl betaine (FTAB)

Potential Product Source Indicator Compounds

Perfluoro octane sulfonamido acetic acids (methyl or ethyl- FOSAA)

- Used in textile coating products manufactured by ECF process
- Preserves branched perfluorocarbon isomers

Polyfluoroalkyl phosphate esters (6:2 or 8:2 diPAP)

- Used in paper coating products
- Biotransforms to perfluoro and fluorotelomer carboxylic acids
 - (e.g. PFHxA, PFOA, 5:3 FTCA)

Perfluorohexane sulfonamides (FHxSA)

- AFFF impacted groundwater (ECF and/or FT based products)

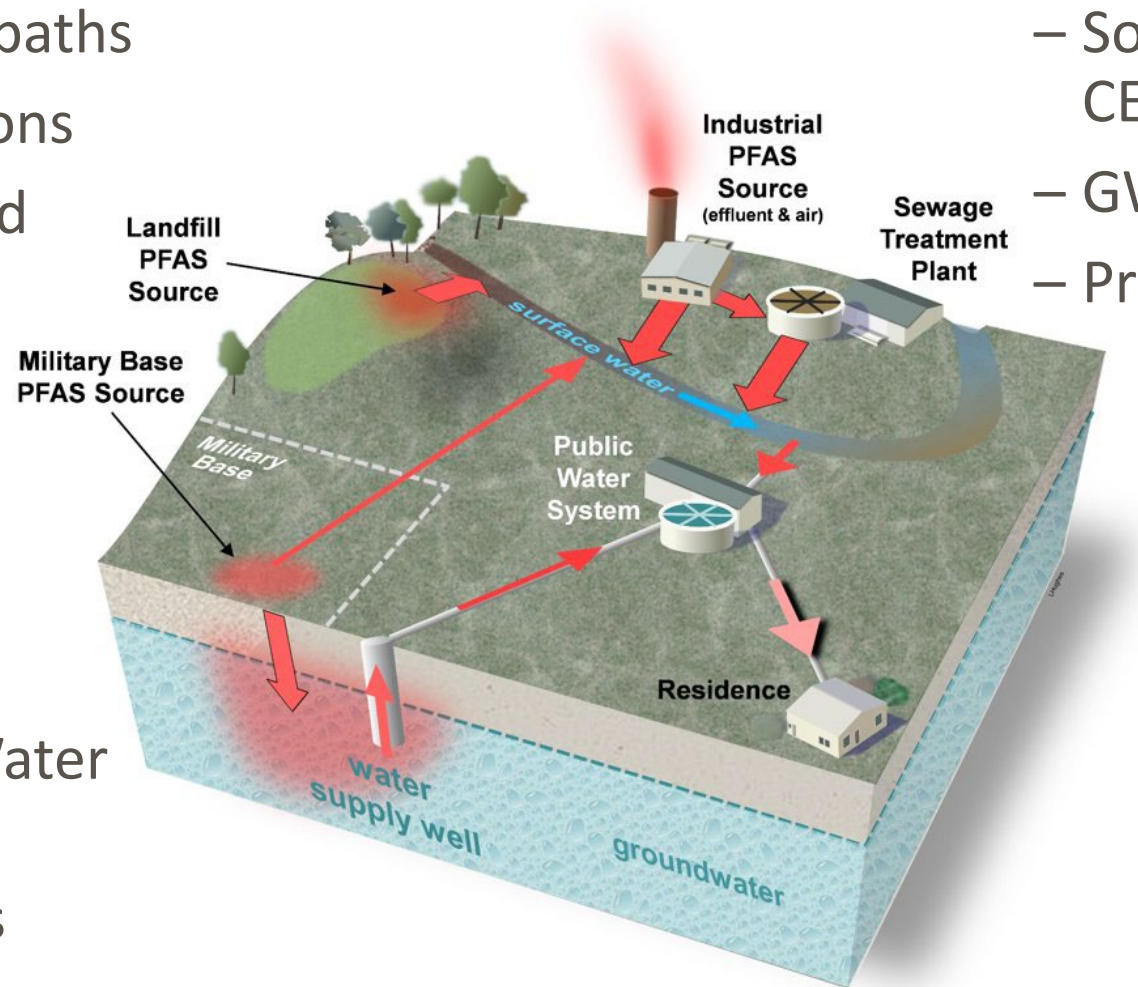

Conceptual Site Model Development

- Understand Hydrogeology

- Preferential flow paths
- GW/SW Interactions
- Aquifer matrix and dimensions

- Geochemistry

- Soil Organic Carbon Content, CEC
- GW pH, Redox Conditions
- Precipitation Rates

- Receptors

- Private / Public Water Supplies
- Ecological Vectors

Effects of Site Hydrogeologic conditions

- Longer-chain PFAS exhibit greater sorption characteristics
- Soil organic matter adsorption is predominant mechanism
- Lower pH, higher CEC (Al^{3+} , Ca^{2+}) increase sorption in low SOM soils
- Aerobic GW enhances biotransformation of precursors

	Organic carbon sorption affinity	Reduction in groundwater migration rate due to sorption
	K_{oc}	Retardation
benzene	66	5.1
PFOA	78	5.8
TCE	126	8.8
PFOS	631	40.1

Retardation values predicted for sandy soil with organic carbon content of 1% by weight

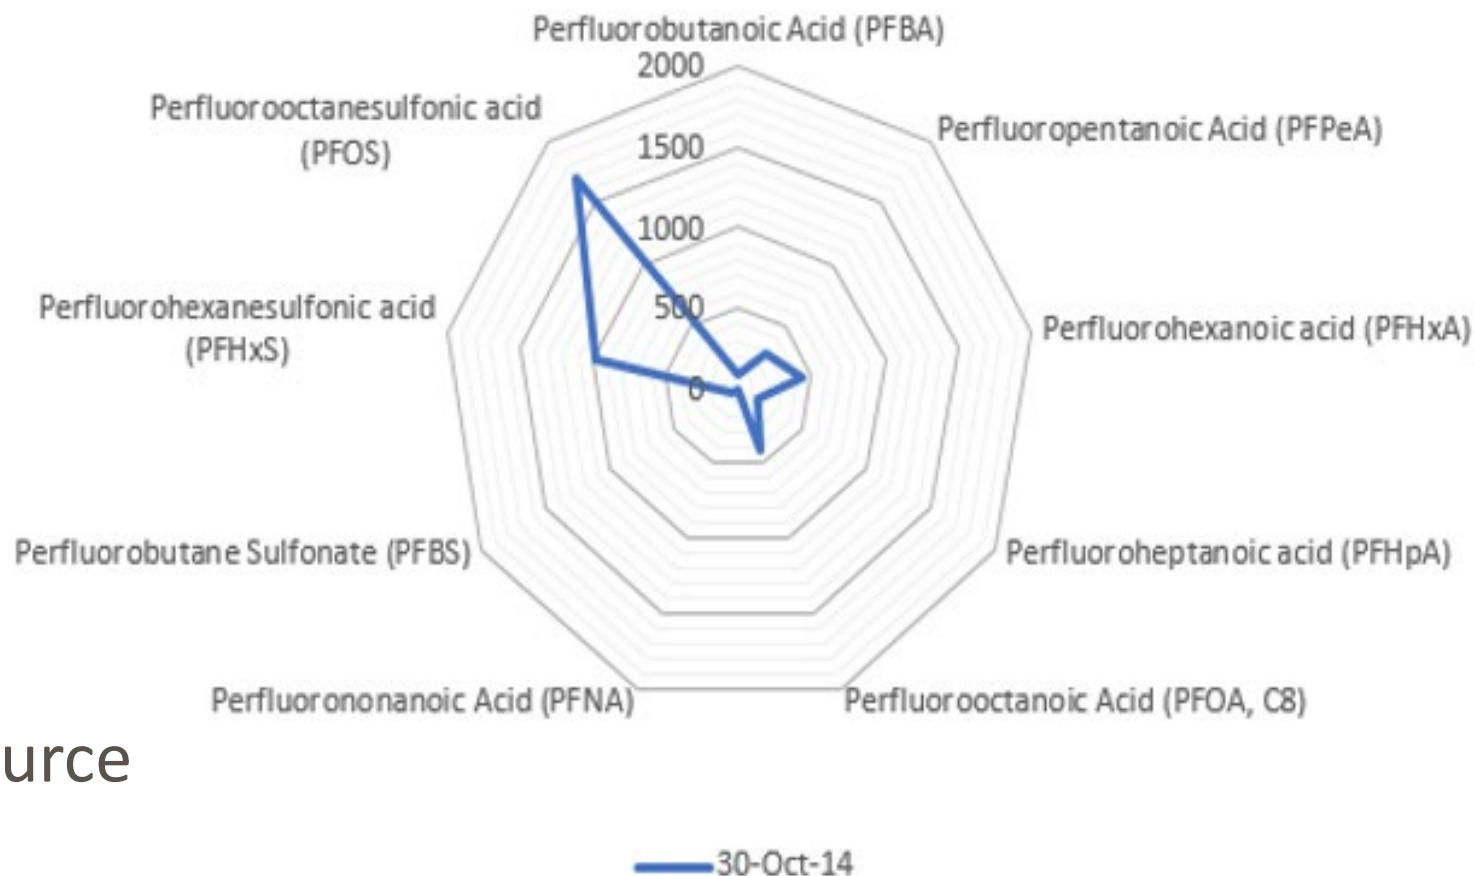

Development of Visual Tools for Source Differentiation

- Stiff Diagrams
 - Used to evaluate water quality
 - Major Cations and Anions
 - Differentiates potential impacts
 - Landfill Leachates
 - Mining wastes
 - Surface waters

Radar Plot Diagrams

- Groundwater Samples
 - Targeted PFAS Compounds
 - PF Carboxylates and Sulfonates
- Evaluate compositions over time/distance
 - Same location
 - Multiple locations
- Qualitatively Differentiate Source Contributions
 - Mixed plumes

Anaerobic Digester Study – Simulated Landfill Leachates

Data from Lang et.al., ES&T 2016

Groundwater Investigation – Fate & Transport Studies

Groundwater Samples

- Long-term multi-year monitoring program
- Suspected source and downgradient locations

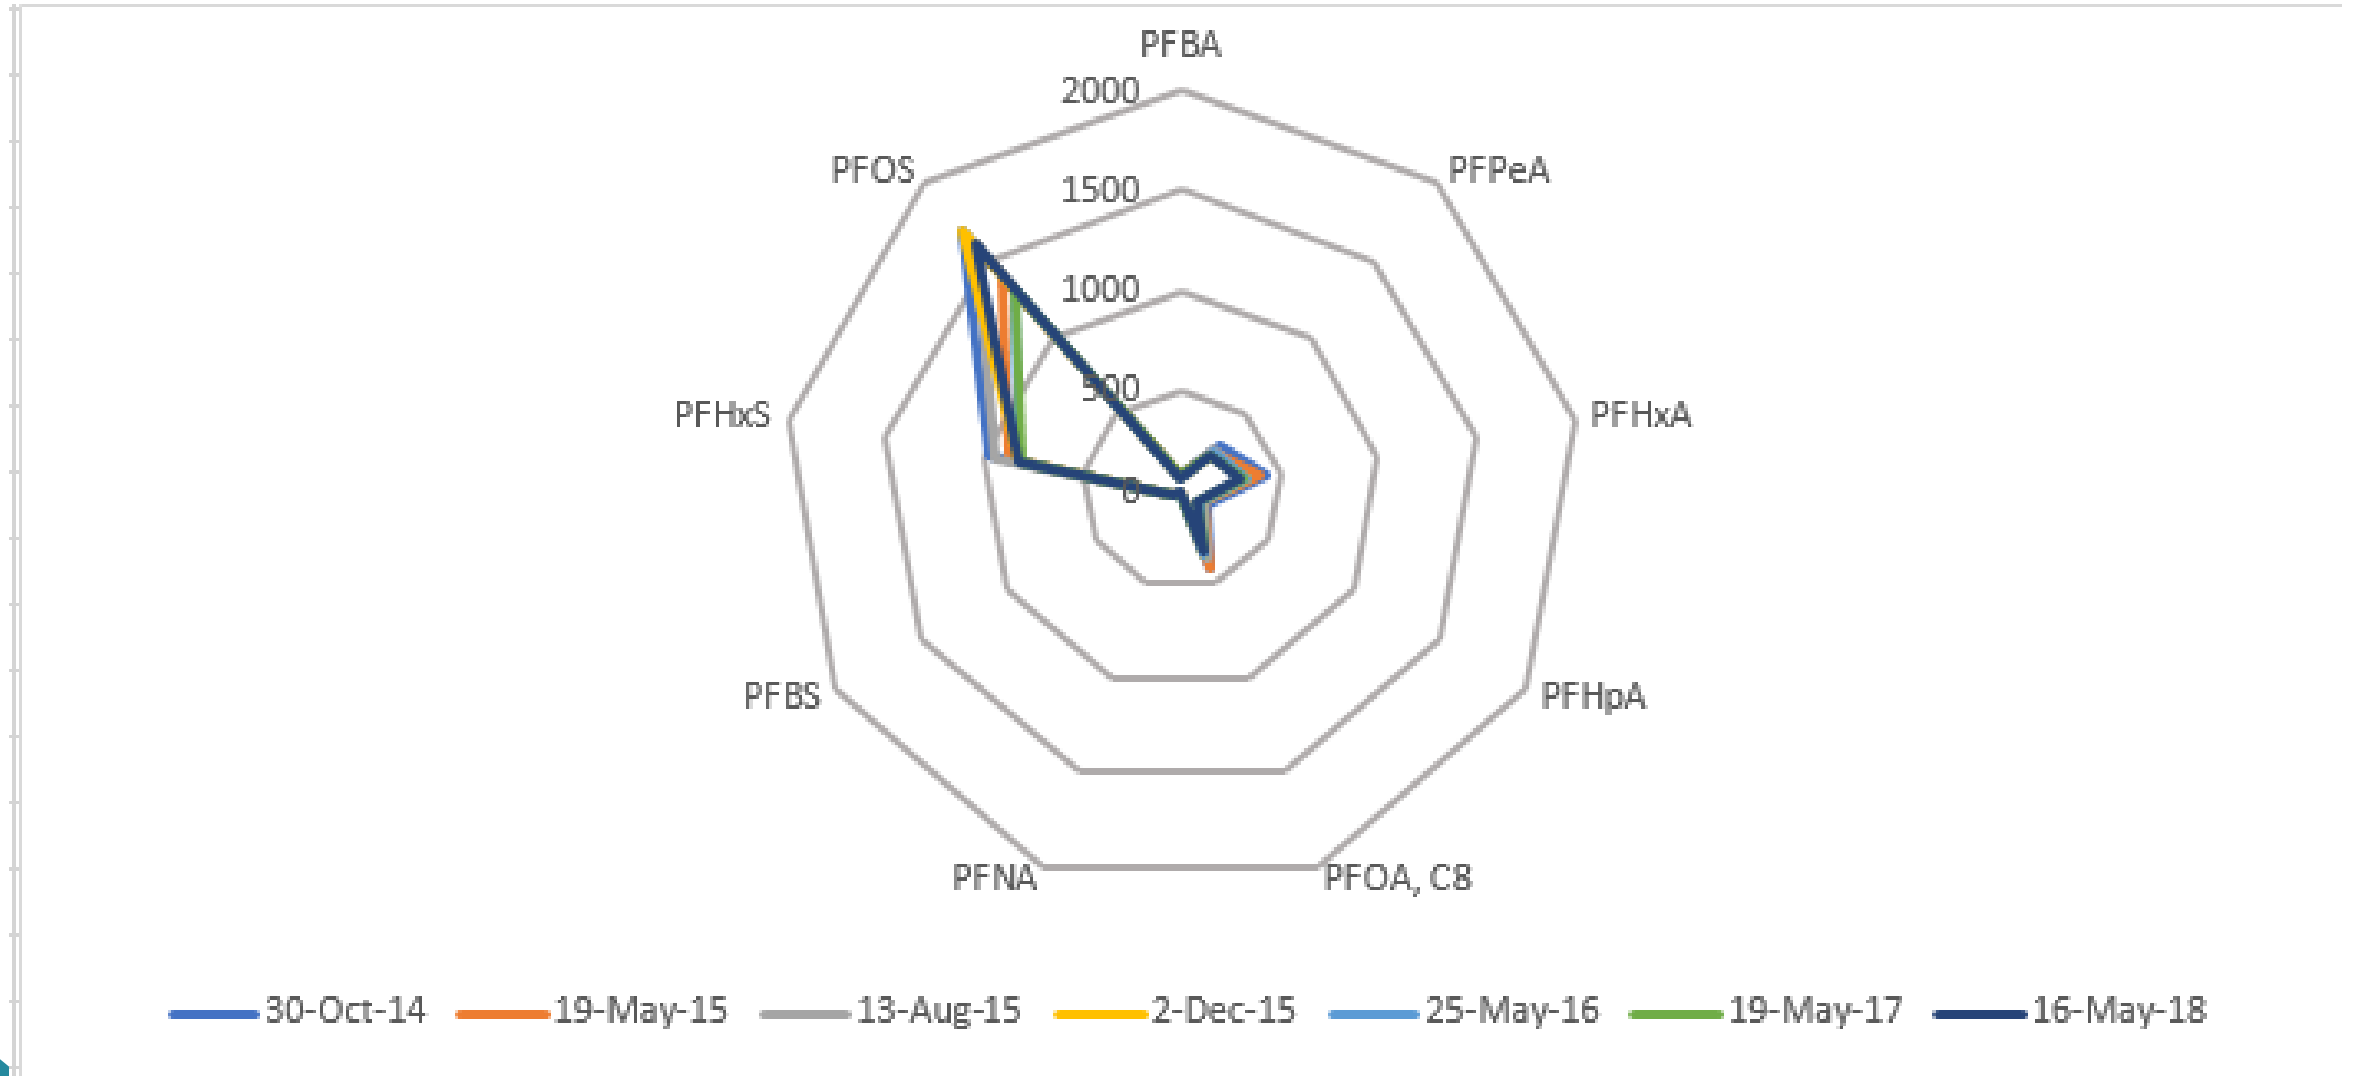

PFAS Targeted Analysis – Project Specific List

- EPA Method 537.1 Modified

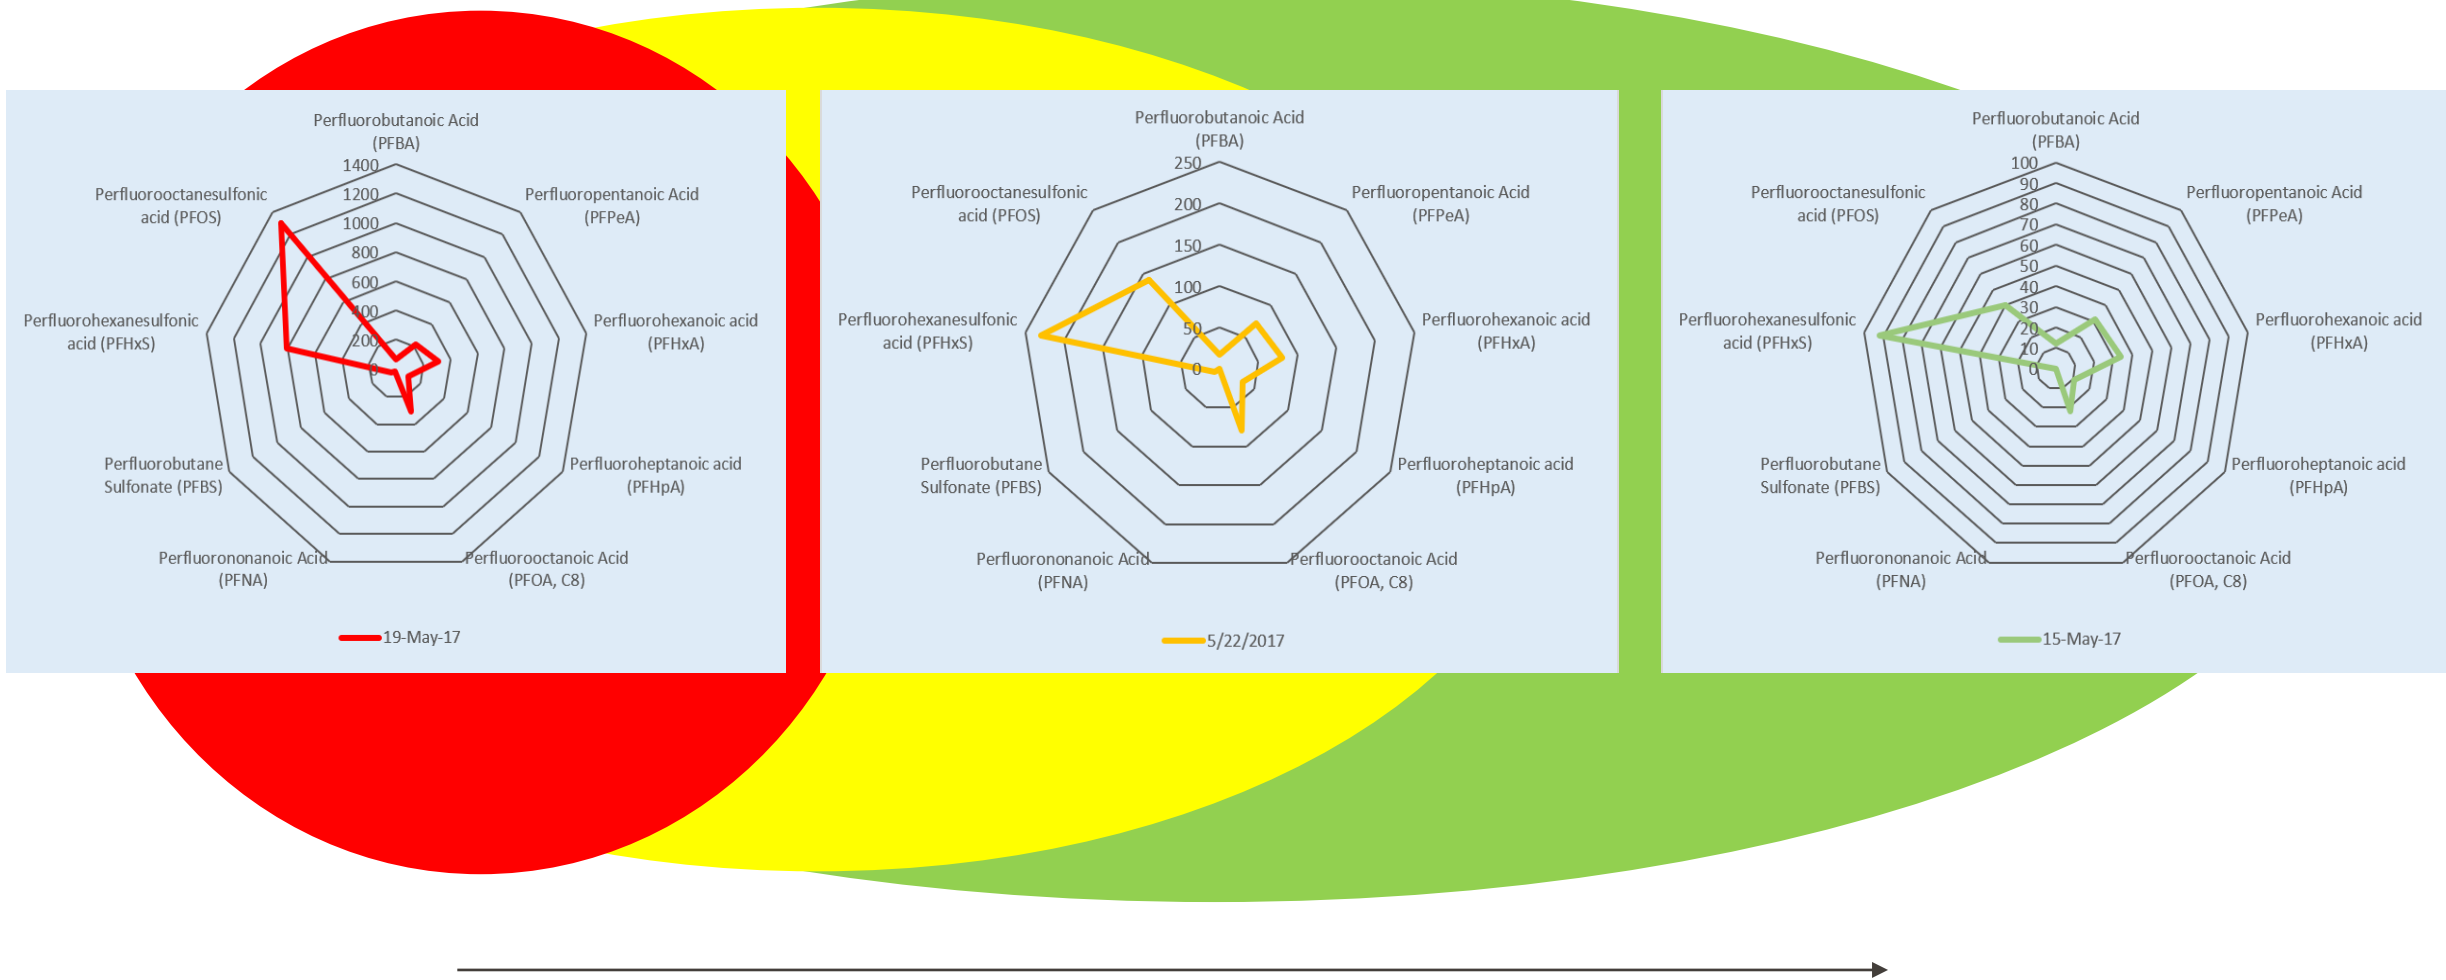

Study Results

- Recalcitrance of source
- Transformation / attenuation observed

PFSA Composition shift over time

PFSA Composition changes with distance

DOWNGRADIENT

PFCA Composition shifts over time

PFCA Composition changes with distance

Surface water Background Study – NE River Systems

Grab Surface water Samples

- Direct bottle collection w dipper cup

PFAS Targeted Analysis – Project Specific List

- EPA Method 537.1 Modified

Study Results

- Unique composition by river system
- Point source contribution identified
- Positive correlation with population density

Selected rivers

- Androscoggin

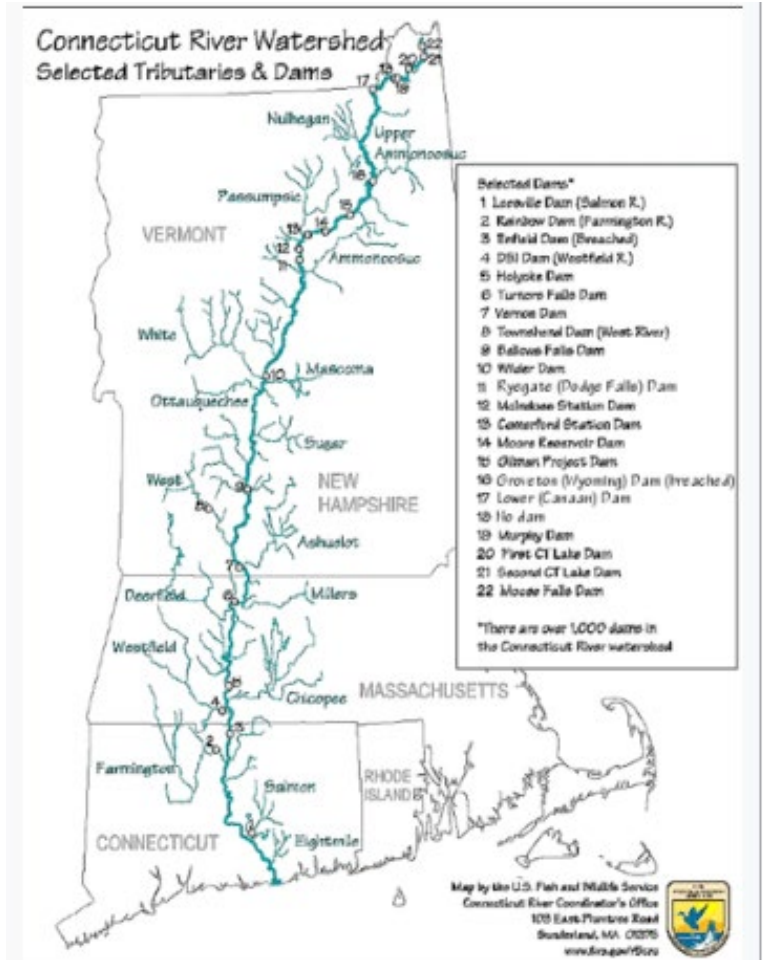

Map of the Androscoggin River watershed

- Merrimack

The Merrimack River and its major tributaries

- Connecticut

River map, with major tributaries and selected dams

Selected rivers

- Androscoggin

- Merrimack

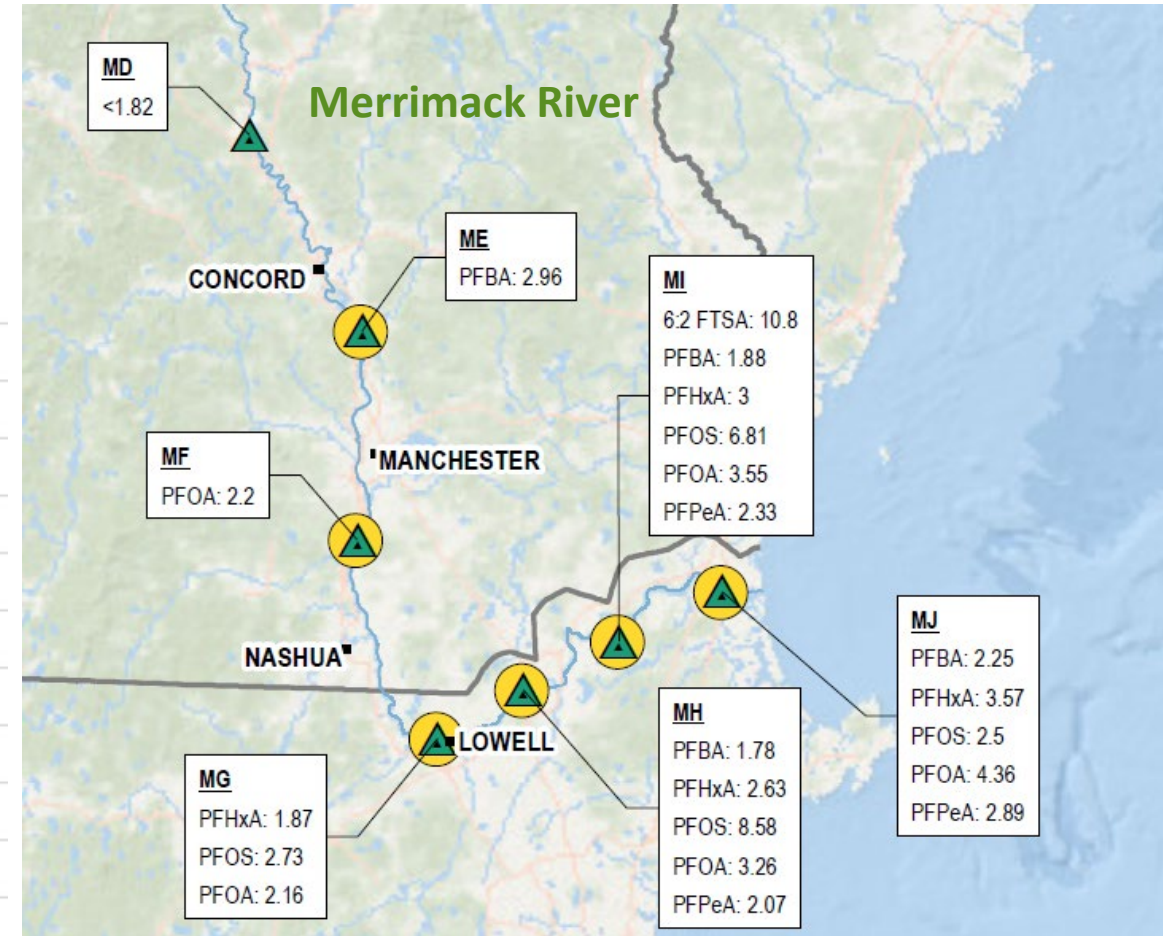

- Connecticut

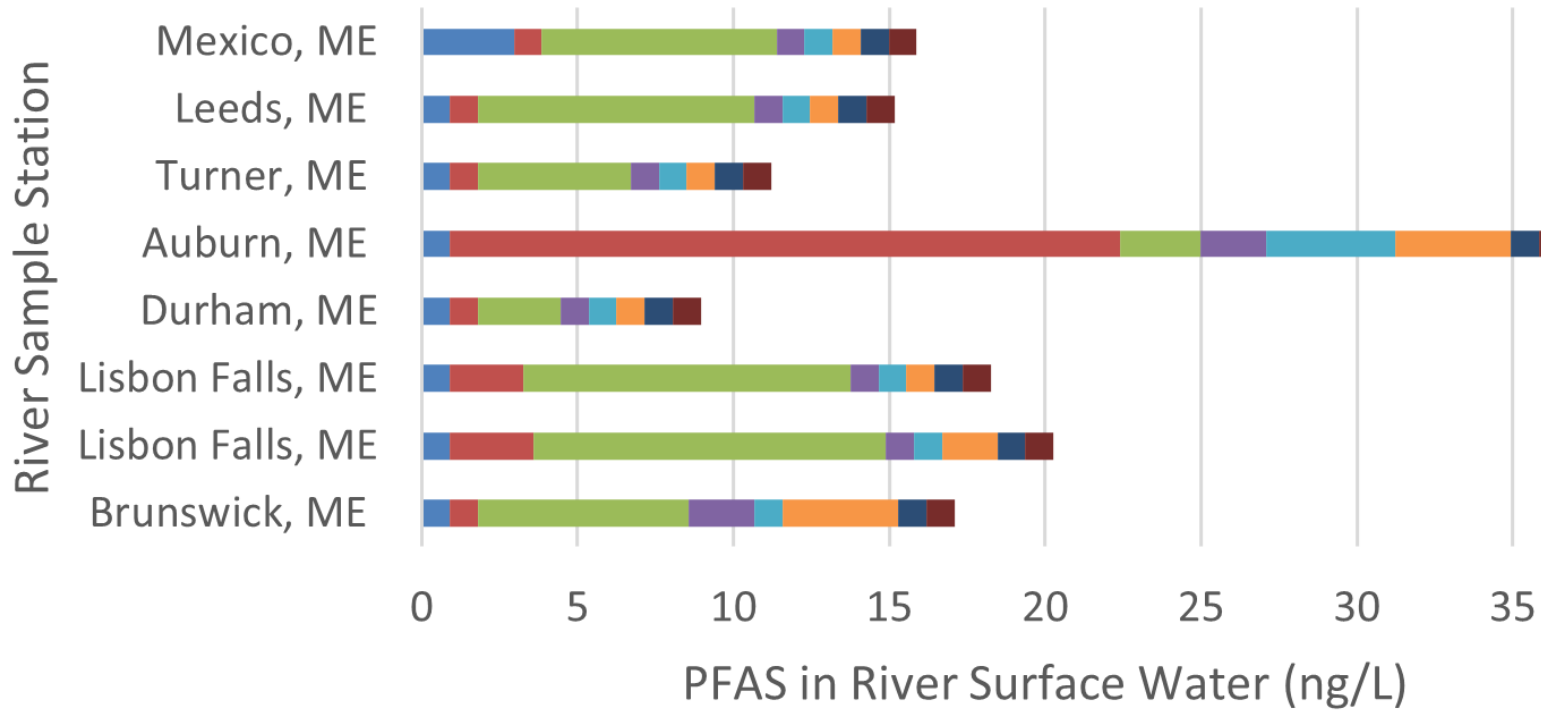

Background PFAS in surface water study

- Increasing total [PFAS] with population density, but no drinking water standard exceedances

Merrimack - Total PFAS (ng/L)

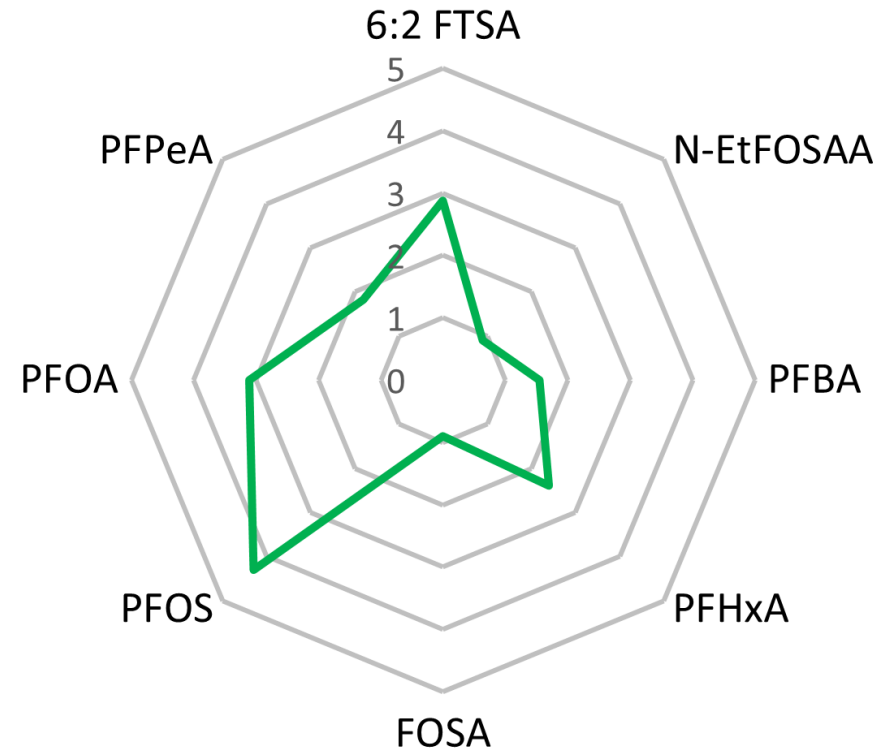

PFAS concentration and distribution: Androscoggin River

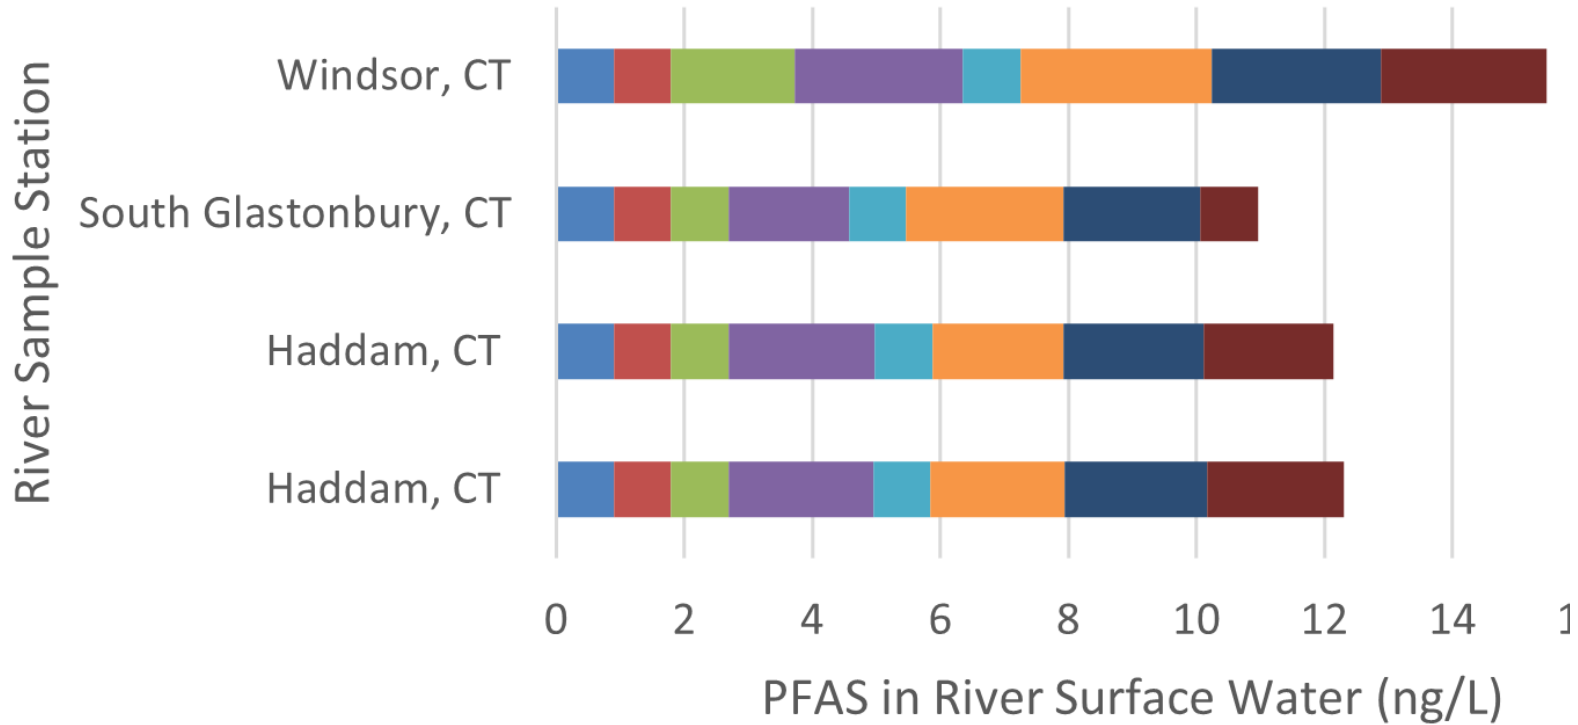

■ 6:2 FTSA
 ■ N-EtFOSAA
 ■ PFBA
 ■ PFHxA
 ■ FOSA
 ■ PFOS
 ■ PFOA
 ■ PFPeA

PFAS concentration and distribution: Merrimack River

■ 6:2 FTSA
 ■ N-EtFOSAA
 ■ PFBA
 ■ PFHxA
 ■ FOSA
 ■ PFOS
 ■ PFOA
 ■ PFPeA

PFAS concentration and distribution: Connecticut River

■ 6:2 FTSA
 ■ N-EtFOSAA
 ■ PFBA
 ■ PFHxA
 ■ FOSA
 ■ PFOS
 ■ PFOA
 ■ PFPeA

Soil Investigation – Suspected AFFF Release

Discreet Soil Samples

- Using Sonic Drilling cores

PFAS Targeted Analysis – Project Specific List

- EPA Method 537.1 Modified – (DOD QSM 5.3)

Study Results

- Demonstrated Attenuation
- Interbedded Sands/Silty Clays
- Consistent with log KOC and soil type

Soils Investigation - Radar Diagrams by Depth/Soil Type

Depth Below Ground Surface

Summary conclusions

To mitigate risk and control impact from releases requires:

- Identification and differentiation between multiple sources
- Use of multiple lines of evidence including:
 - Determination of the source materials through direct or indirect analysis,
 - Understanding hydrogeologic and geochemical conditions,
 - Evaluation of the potential for transformation of non-target analytes.

Use of Visual Tools enables efficient evaluation of potential sources

- Assist in identifying point sources and/or discharge areas
- Can differentiate between contributing sources within co-mingled plumes
